

# XenaManager-2G

## User Manual

This is the User Manual for XenaManager-2G (i.e. 2nd Generation).  
XenaManager-2G is the primary software application used to manage and  
configure the Xena Networks Layer 2-3 test products.

The application connects to one or more testers using their IP addresses, and  
provides a comprehensive point-and-click user interface for configuring and  
running the testers.

Note: In 2015 XenaManager-2G replaced the original XenaManager  
application in Xena software releases. The differences between the two  
version are **described on this page**.

Last updated: 2017-09-26

## INSTALLATION

XenaManager-2G is a standard Windows application which is supported on Windows XP with Service Pack 3 and higher (Vista, Windows 7, 8, 8.1 and 10). It requires Microsoft .NET version 4.0.

It is installed as part of the standard Xena software release package [which can be obtained here](#).

After installation you can find a shortcut to the application in the **Start -> Programs -> Xena Network** menu and also (if you have selected this during setup) on your desktop.

## GENERAL INFORMATION

### GETTING STARTED WITH XENAMANAGER-2G

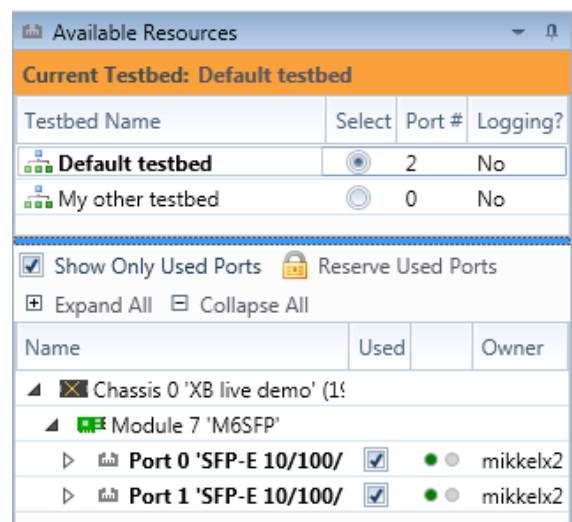

This short guide will help you get started using XenaManager-2G.

Our first step will be to show you how to set up a simple bi-directional layer-2 Ethernet switching test scenario.

#### Configuring Your First Testbed

A testbed is a collection of ports that you currently work with. Several XenaManager-2G panels will only show information for ports that are in your current testbed. This includes the port and stream configuration grid panels, and the Global Statistics panel.

1. Press the **Add Chassis** button located to the left in the ribbonbar at the top of the application.
2. Fill in the IP address or hostname of the chassis, optionally change the portnumber, enter the password and click **OK** button. The **Available Resources** tree view at the left will now populate with the modules and ports contained in the chassis.
3. A new configuration has been created automatically when you start the application for the first time. This configuration contains a single default testbed called "Default Testbed". You can see this testbed at the top of the resource tree view. You can create any number of testbeds. For now we will use the default testbed to start with.

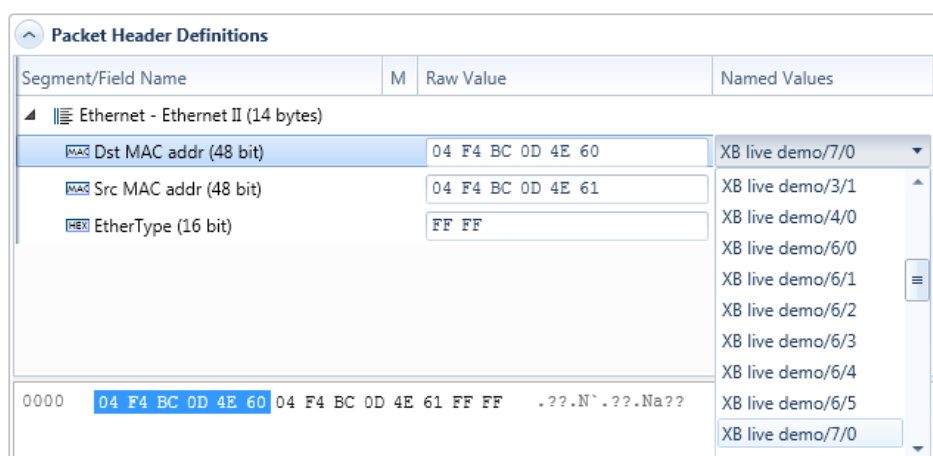

4. You can now add ports to your testbed. This is done by clicking the checkbox in the **Used** column to the right of the port name in the resource tree. Add two ports to your testbed in this way. Please ensure that the two ports are connected through a standard layer-2 switch.
5. If you only want to see the ports included in your testbed you can click the **Show Only Used Ports** checkbox in the testbed selection part of the resource tree.
6. To quickly reserve all ports in your testbed click the **Reserve Used Ports** button next to the **Show Only Used Ports** checkbox. Note that ports are not automatically reserved just because you have included them in your testbed.

## Configuring Streams

In this section we will setup a single stream on each testport in your testbed. We will set each stream to target the other port.

- To quickly create a stream on your testport you can right-click on the port and select the **Add Stream** menu item. Create a stream on both your testports in this way.
- Select the new stream on the first port and ensure that you have selected the **Resource Properties** panel. The panel will now display the properties for the stream.
- Scroll down to the **Packet Header Definitions** section in the stream properties view. Here you will find a Wireshark-like protocol header editor which allows you to define the protocol headers for the stream.
- Expand the **Ethernet** segment to view the fields in the segment. Note that the **Src MAC Address** field has been automatically set to the MAC address of the containing port.
- Expand the dropdown-box in the **Named Values** column for the **Dst MAC Address** and locate the other port in your testbed. Note that the **Raw Value** column is also automatically updated with the MAC address of the peer port.
- Perform the same operation for the second stream on the other port.

### Viewing Statistics

In this section we will show how to control traffic on your testbed as a whole and also how to monitor traffic on all ports and streams in the testbed.

Change to the **Global Statistics** panel. You should now see your two testports in the testbed in a grid view.

Press the **Clear Counters** button in the toolbar at the top of the panel to ensure that you start with a clean view.

Press the **Start Traffic** button to start traffic on all testports in your testbed. You should now see the TX and RX traffic counters start to increment for both ports.

Press the **Stop Traffic** button to stop the traffic on both ports.

**Note:** The Global Statistics view will only show ports and streams that are used by your testbed. If you require to briefly inspect the statistics counters for another port you can use the single-resource **Port Statistics** panel which will show statistics for the currently selected port, regardless of whether it is in your testbed or not.

## ENTERING VALUES

This section explains how values are entered in the XenaManager-2G.

Editable values are initially shown with a normal black font:

Speed Reduction:  ppm, emulated

When you start to edit a value the value will be shown in green color if the value you enter is valid:

Speed Reduction:  ppm, emulated

If the value has a wrong syntax or it is out of range it is shown in red color:

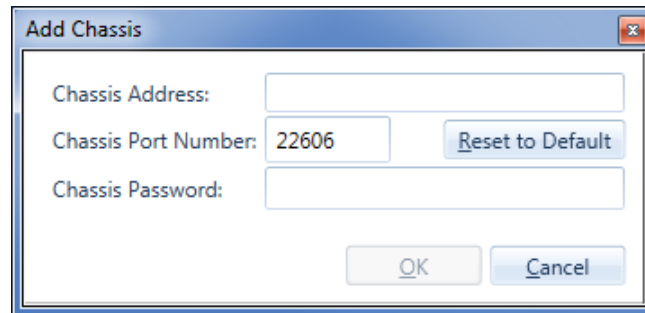

Speed Reduction:  ppm, emulated

When you click away to another field, or press the <TAB> or <ENTER> key, the value is submitted to the Xena chassis. When validated the new value will be shown with the normal black color.

## CHASSIS MANAGEMENT

### Connecting to a Chassis

Chassis definitions are contained in the overall test configuration. You can add a chassis by pressing the **Add Chassis** button in the main Edit ribbon menu. You will then see the following dialog window:

The image shows a Windows-style dialog box titled "Add Chassis". It contains three input fields: "Chassis Address:" (empty), "Chassis Port Number:" (containing "22606"), and "Chassis Password:" (empty). To the right of the "Chassis Port Number" field is a button labeled "Reset to Default". At the bottom of the dialog are two buttons: "OK" and "Cancel".

1. Fill in the IP address or hostname for the chassis in the Chassis Address field.
2. Optionally change the Chassis Port Number value if you connect to the chassis through a NAT router that changes the port number. The default port value is 22606. If you have changed the port value and want to revert to the default value you can press the Reset to Default button.
3. Enter the assigned password for the chassis in the Chassis Password field.
4. Press the OK button.

The next time you open the Add Chassis window it will remember the last values you entered. If you have changed the port number and need to revert to the default Xena port number just press the Reset to Default button.

### Editing the Chassis Address

If you need to modify the address or password details for a chassis you can select the chassis in the resource tree view and press the **Edit Chassis** button in the ribbon menu. You will then see a window similar to the **Add Chassis** window where you can change one or more of the values.

Note that the **Edit Chassis** button will only be enabled if you are not currently connected to the chassis (we assume that if you are connected to the chassis you have no need for changing the defined address)

This action is also available in the right-click context menu for the chassis item in the tree view.

### Reconnecting to a Chassis

If you have lost the connection to a chassis, for instance due to a local network connectivity outage, you can manually reconnect by selecting the chassis in the resource tree view and press the **Reconnect to Chassis** button in the ribbon menu.

This action is also available in the right-click context menu for the chassis item in the tree view.

### Disconnecting from a Chassis

You can forcibly disconnect from a defined chassis without removing the definition from the configuration. This will also prevent XenaManager-2G from making any attempt to reconnect to the chassis, until you specifically choose to reconnect to that chassis. You can use this option if you have a chassis defined in your configuration that you know will be offline for a longer period of time.

### Removing a Chassis

If you no longer need a certain chassis in your test configuration simply select the chassis and press the **Remove Chassis** button in the ribbon menu.

This action is also available in the right-click context menu for the chassis item in the tree view.

### Refresh Chassis

You can also refresh the chassis configuration by selecting an appropriate option in the right-click context menu:

- **Refresh Chassis:** This will refresh the chassis instance configuration.
- **Refresh All Chassis:** This will refresh the chassis and associated resources, i.e. all modules and ports contained in it.

### Troubleshooting

#### If the password is lost:

The default value of the password is xena, which can be changed from the Chassis Properties panel of XenaManager-2G.

If the password is forgotten the following method can be used to gain access to the chassis: after power-on when the test port LEDs start flashing, for the next two minutes the chassis will accept its own serial number (which is printed on the label at the back of the chassis) as a backup password.

#### If the IP address is lost:

The extension port is not used in normal operation. It serves as a backup with a known IP address (172.16.255.200) if the address of the management port is lost.

## TESTBED MANAGEMENT

This section explains how you can manage the various testbeds in a test configuration.

A testbed is a collection of ports that you currently work with. Several XenaManager-2G panels will only show information for ports that are in your current testbed. This includes the port and stream configuration grid panels, and the Global Statistics panel.

### Configuration Hierarchy

The top-most configuration entity you work with is the test configuration file. This file contains all information about these items:

- Connected chassis
- Testbeds
- Currently selected testbed

All testbeds thus share the same pool of chassis (and by extension their ports).

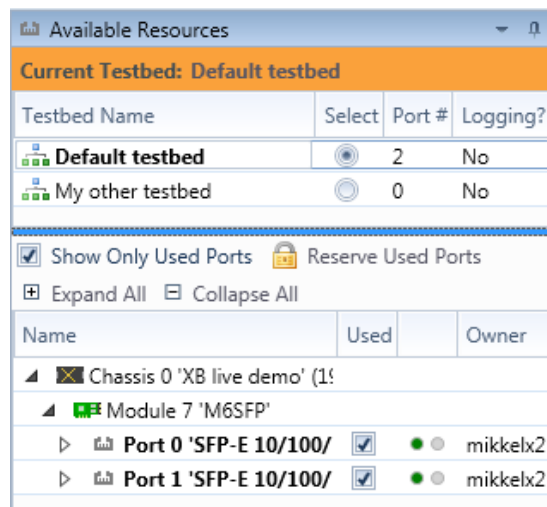

In the first generation of the XenaManager the chassis was configured as part of the testbeds. But this has been changed in XenaManager-2G so that chassis definitions and testbeds are defined orthogonally.

### Setting the Current Testbed

You can only have one active testbed at a time. The active testbed is selected with the **Current Testbed** control at the top of the **Available Resources** panel.

To select a testbed as the current you can either select the radiobutton in the **Select** column or you can simply doubleclick on the testbed entry.

When you change the selected testbed the content of all the dependent panels (see above) will also change.

### Creating a Testbed

You can create a new testbed definition by clicking the **Create Testbed** button in the ribbon menu at the top of the application. You will then be presented with a window where you can provide a unique name for the new testbed and optionally also provide a longer description.

The description will be shown as a tooltip when you hover with the mouse over the testbed selector.

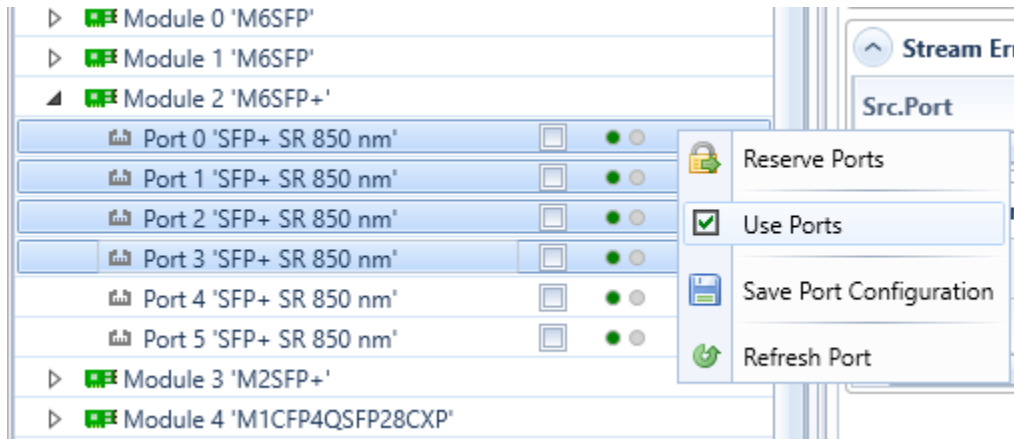

When you create a new testbed this will automatically be set as the currently selected testbed.

## Adding and Removing Testbed Ports

You can add a port to your currently active testbed by selecting the checkbox in the **Used** column next to the port name in the **Available Resources** tree view. You remove a port from your testbed by deselecting the checkbox.

You can also select multiple ports in the tree view, right-click and select the **Use Ports** menu item. This also works when you want to deselect multiple ports.

You can quickly reserve all ports in your current testbed by clicking the **Reserve Used Ports** button just below the testbed selector. Note that your reserved testbed ports will not be automatically released when you change your current testbed.

## Editing a Testbed

You can edit both the testbed name and the description by clicking the Edit Testbed button in the ribbon menu.

## Removing a Testbed

To remove a testbed you need to select the testbed with the testbed selector and then click the **Remove Testbed** button in the ribbon menu.

You can select multiple testbeds for removal at the same time using either <Ctrl>- or <Shift>-leftclick.

## RESOURCE RESERVATION

This section explains how chassis resources are reserved.

### Chassis Resources

A “chassis resource” can be either the chassis itself, a testmodule on the chassis or a testport on a module.

The Xena testers support multiple simultaneous connections from any mixture of Xena clients, such as the XenaManager, scripting clients, Xena2544, etc. As soon as a client has successfully established a connection to the chassis any chassis resource can be inspected. But in order to change the resource configuration the resource must first be reserved by the client.

### Reservation Mechanism

Only one client can reserve a particular resource at a time. The reservation will be active even if the client is disconnected. If the client re-connects at a later time and identifies itself with the same username any such “left-over” reservations will automatically be transferred to the new connection.

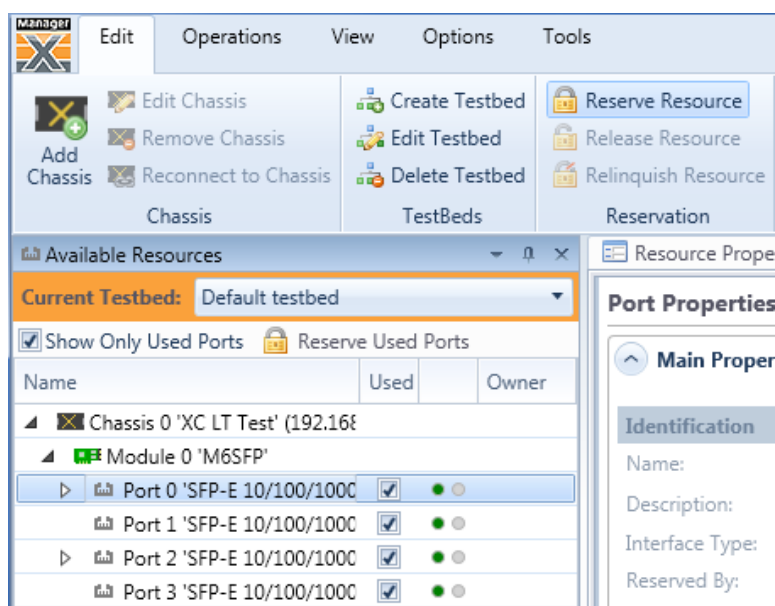

The reservation belongs to a combination of the connection ID in the chassis and the specified username. The username is simply used as a tag for the reserved resource, and the chassis have no notion of actual ‘user accounts’. Multiple connections could use the same name, but any resource will only be reserved to one connection at a time.

The default username for the XenaManager-2G is the Windows username for the current user. You can change the username for XenaManager in the **Options** menu. The username can contain up to 8 characters.

### Reserving a Resource

To reserve a resource you select the resource in the tree view and click the button in the ribbon menu. Alternatively you can right-click the resource and select the equivalent menu item. To reserve a resource you select the resource in the tree view and click the button in the ribbon menu.

Alternatively you can right-click the resource and select the equivalent menu item. To reserve a resource you select the resource in the **Available Resources** tree view and click the **Reserve Resource** button in the ribbon menu. Alternatively you can right-click the resource and select the equivalent menu item.

Once you have reserved the resource all configuration options for that resource will now be enabled.

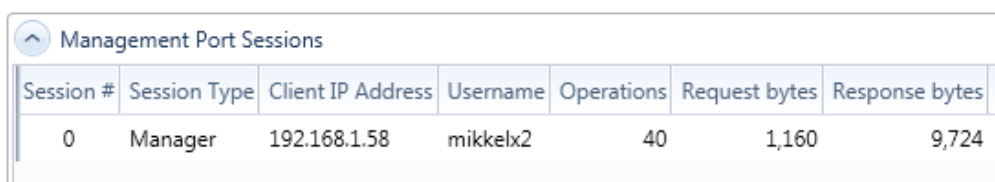

You can quickly reserve all ports in your current testbed by pressing the **Reserve Used Ports** button located just below the testbed selector.

## Releasing a Resource

To release any resource reserved by yourself you select the resource in the tree view and click the **Release Resource** button in the ribbon menu.

## Relinquish Resource

To forcibly take away a resource from another user you can select the **Relinquish Resource** option instead. You will be prompted to confirm this action before it is executed.

Session #	Session Type	Client IP Address	Username	Operations	Request bytes	Response bytes
0	Manager	192.168.1.58	mikkex2	40	1,160	9,724

Before relinquishing resources reserved by another user it may be a good idea to check if that user has an active connection on the chassis. Otherwise you may quickly get rather unpopular among your co-workers.

You can check the active connections on a chassis by selecting the chassis in the **Available Resources** tree view and activating the **Resource Properties** tab. The active connection are listed at the bottom of chassis properties panel.

## Handling Multiple Resources

It is possible to operate on multiple resources in the tree view using the standard Windows [Shift-Click] or [Ctrl-Click] mouse operations.

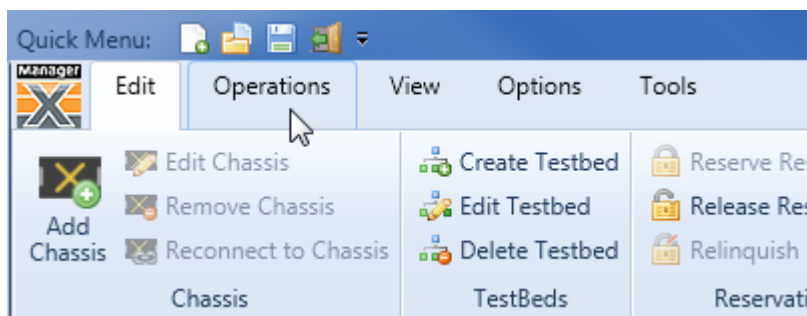

## Reservation Hierarchy

Reservations are hierarchical exclusive which means that if user **Albert** has reserved a given testmodule then user **Bertha** will be prevented from reserving any port on that module. The same applies to chassis reservations. However user **Albert** does **not** reserve the ports on the testmodule by reserving the testmodule itself.

In general you do not need to reserve modules and chassis to perform normal traffic generation operations. You should only reserve ports. Reserving modules and chassis are only necessary when performing system maintenance, software upgrades or changing the port types on certain modules.

## RIBBON MENUS

This chapter describes the ribbon menus and other application-level menus for the XenaManager-2G application. The XenaManager-2G features a modern ribbon menu similar to applications like Microsoft Word. Each of the submenu items are explained below.

### Edit Menu

This menu contains the main simple editing functions. Each function is context sensitive and is only enabled when a suitable selection of resources is selected in the **Available Resources** tree view.

Each function is usually explained in a different section of this WIKI and will not be explained further on this section.

### Operations Menu

This menu contains functions that can perform more complex operations on one or more resources.

#### Release All Resources

This command will release all resources (chassis, modules and ports) that has been reserved by you. You can use this to clean up your reservations if you have many chassis, modules and/or ports and do not want to traverse through the Available Resources tree view to manually release everything you may have reserved.

#### Import XM-1G Testbed

Using this option you can import a legacy XenaManager testbed definition. Simply click the button and select the testbed file you have previously exported from the legacy XenaManager. A new XenaManager-2G testbed will be created with the definitions from the legacy definition.

#### Import Test Case

Enables you to import settings from a XenaManager-2G testcase file.

#### Export Test Case

Enables you to save the complete port configurations for all ports in your current testbed.

#### Import XI LogCfg

Refer to [this page](#) for further information.

## Pair Streams

This operation work on two streams defined on different ports. It requires that you select the two streams in the **Available Resources** tree view.

When invoked it will ensure that certain fields in the defined packet headers for each of the two streams point to the other stream.

- Ethernet segment: The DMAC Address field will be set to the MAC address of the peer port.
- IPv4/IPv6 segment: The Dest. IP Address field will be set to the defined IP address for the peer port.

This should ensure that when the traffic is started the traffic on a port actually reaches the other port. For IP traffic you may have to resolve the IP gateway MAC address using ARP if the two ports are located on different IP subnetworks.

## Preview Stream

This operation will enable you to preview the actual packets sent on a stream before starting a test. This is especially useful if you have defined one or more modifiers on the stream and wants to ensure that the result looks correct.

The function require that you select a single stream in the Available Resources tree view.

When invoked the operation will perform the following actions:

- Stop traffic on the port if it is currently active
- Disable all other streams on the port after saving their initial state
- Set the port in Tx(off)-to-Rx loopback mode.
- Setup and start capture on the port itself
- Start traffic on the port
- Let the traffic run until the capture buffer runs full. The traffic will also be stopped after 10 seconds if the buffer is still not full.
- Collect the captured packets and save them to a temporary file.
- Restore the saved port and stream settings.
- If Wireshark is installed it will be launched to view the captured packets. Otherwise you will have to use the Capture panel to inspect the packets.

## View Menu

This menu contains functions that affect the visual appearance of the application.

## Panel Layout

Checking the **Freeze Layout** checkbox disables the ability to show or hide panels and to drag panels to other docking positions or to make them float-able. You can use this to protect yourself against unintended changes.

Pressing the **Set Panel Visibility** button will open a dialog that allows you to control the visibility for each of the function panel tabs available in the application. You can also hide any of the panels by selecting it and then clicking the little “X” to the right of the tab panel header as shown in the adjacent example. To bring the panel back you can use the above mentioned dialog and click the checkbox next to the name of the hidden panel.

When you make changes to the layout the new layout will be restored when you startup the application again. The **Reset Layout to Default** button will delete the saved layout. The next time you start the application the original layout will thus be restored.

### Resource Labels

If you check the **Stream Descr As Label** option the stream description label will be used to name the stream entries in the resource tree view instead of using the default “module/port number” identification.

### Debug settings

This section contains settings intended for advanced users. The **Show SW Upgrade Controls** will unlock the manual software upgrade control in the chassis and module properties. This is as indicated only recommended for advanced users who fully understand what they are doing.

### Options Menu

This menu contains various functions that affect the behavior of the application.

#### Set Username

The default username for the application is your Windows username. You can change this with this function.

#### Open Last Configuration as Start

If this option is checked the configuration file that was active when you closed down the application the last time will automatically be re-opened on the next application start.

#### Ask Before Relinquishing Ports

If this option is checked you will be asked to confirm if you really want to relinquish ports reserved by other users. This is also the recommended setting.

#### Sync Start in Global Stats

If this option is checked the **Start** button in the **Global Statistics** panel will use a synchronized port start mechanism for the ports if the chassis firmware version supports this feature.

### Tools Menu

This menu contains various shortcuts to other tools.

## Xena Test Applications

This section will show an icon for each of the other Xena test applications installed together with the XenaManager-2G, such as Xena2544, Xena1564, etc. You can launch each of these application by pressing the icon button.

## Support

If you click the **Generate Support Archive** button the application will create a compressed ZIP archive containing both the currently loaded configuration file and the content of the Logs and Settings directories. This file can then be emailed to your support representative. See more details on the [troubleshooting page](#).

Clicking the **Explore Xena Data Directory** will open a Windows Explorer in the data directory for the XenaManager-2G. Here you can find configuration and settings files, log files and any support archive files you may have created.

## Minimizing the Ribbon

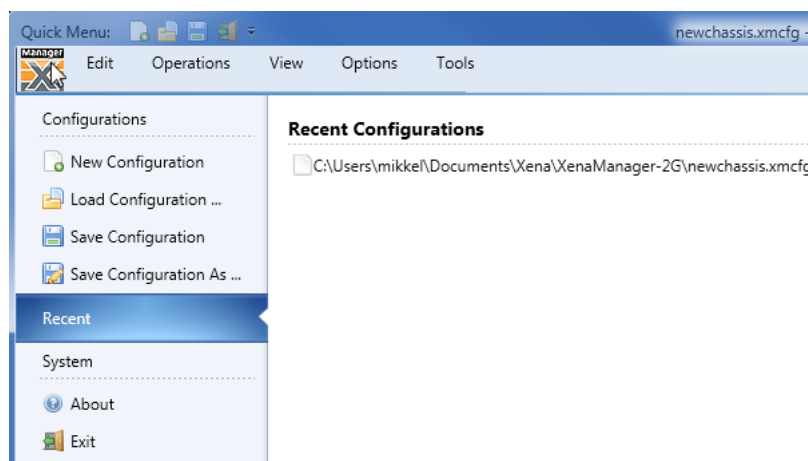

The ribbon menu will by default be shown fully expanded. In order to free up screen space you can minimize it by clicking the arrow next to the Help icon in the menu title line as shown below to the left. You can also use the little arrow in the Quick Menu strip as shown below to the right.

## Additional Features

### Application Menu

The application menu can be accessed by clicking the XenaManager icon in the top left corner as shown below.

Using the functions in the **Configurations** section you can either create a new test configuration, load an existing configuration from file, or save the current configuration.

The **Recent Configurations** section in the middle allow you to load any recently loaded or saved configurations.

## Quick Menu Toolbar

The **Quick Menu** toolbar at the top of the application provides easy shortcuts to the most used application-level commands.

## GENERAL USE INTERFACE BEHAVIOR

This section describes the general layout and intended usage of the user interface elements in the XenaManager-2G application.

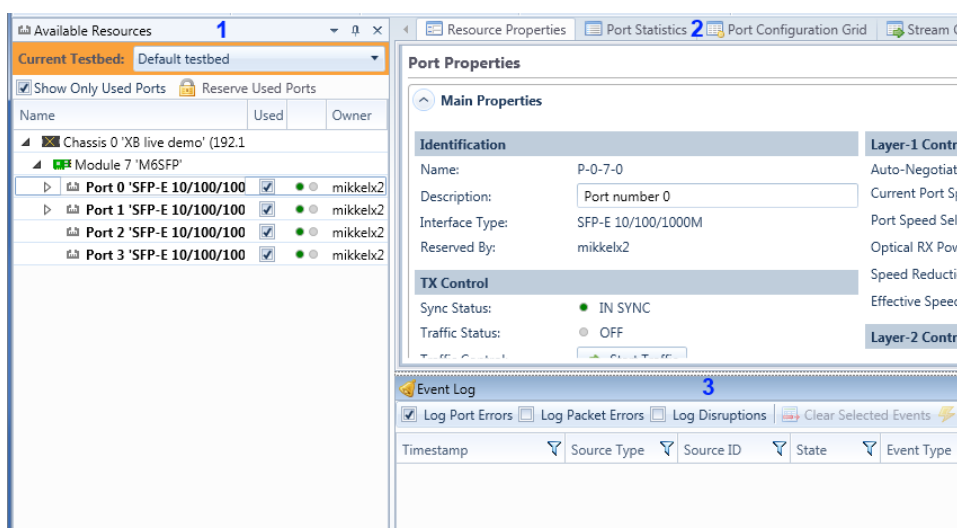

## Docking Panels

The XenaManager-2G uses a so-called *docking panel framework* where each panel can be docked in various positions. The user can thus customize the layout of the application to some extent.

## Docking Positions

Any panel can be docked in several positions. The image below show the three standard positions:

1. Left,
2. Document Center
3. Bottom.

It is also possible to dock a panel in these positions:

- Right (creating a sidebar similar to the Left position)
- Top (above the Document Center tab)

## Docking Panels

To move a panel to a new docking position perform the following actions:

- Grab the tab header with the mouse and drag it to release it from the present location.
- You will now see a “compass rose” with arrows in all four directions, as shown below.
- Hover the mouse over the arrow that represent the position where you want the panel to go and release the mouse.
- You can also hover over the center in the “compass rose” in which case you will target the “Document Center” position.

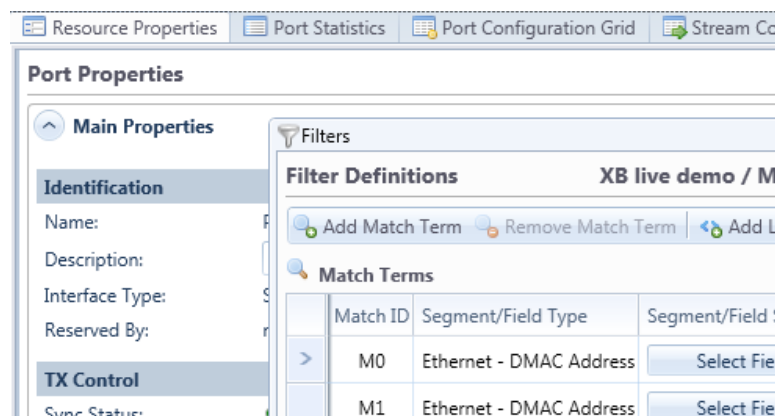

## Positioning Panel

You can change the relative position of a panel by grabbing the panel header with the mouse and drag it left or right within the position tab it is currently located in.

## Floating Panels

You can also choose to let a panel float outside the docking framework. Just drag it from the current position and release it where you want it to be located.

## Hiding Panels

You can control the visibility of the panel as [described on this page](#).

## Restoring Default Layout

If your layout gets messed up you can easily revert to the default layout via the **View** menu and clicking the **Reset Layout to Default** button.

## SAVING AND RESTORING PORT CONFIGURATIONS

The actual configuration of the testmodules, testports, streams, etc. are **not** saved as part of the **testbed configuration** as this type of configuration generally resides on the testchassis themselves. This has the advantage that the configuration is then available to all connected users.

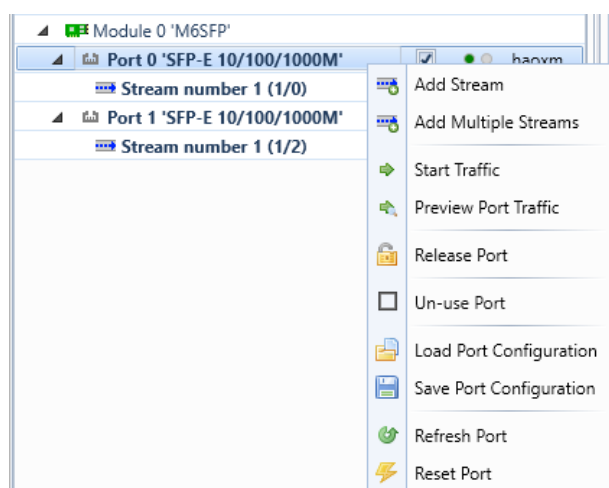

The port and module configuration in the test chassis are however **not persistent** so if you want to preserve these configuration settings you will have to manually save them to one or more local files on your PC.

## Working With Single Ports

### Saving Port Configurations

You can save all configuration parameters for a port to a single file thus enabling you to restore them at a later stage. This includes all port-level parameters such as filters, histograms and capture setup and also all stream and modifier configuration for that port.

To save the configuration for a port you simply right-click on the port and select **Save Port Configuration** as shown in the image. You will then be asked for a filename and location for the configuration file.

You can also select multiple ports and save their configurations in a single operation.

The port configuration will be saved to a file with extension \*.xpc (Xena Port Configuration). Each \*.xpc file will only contain the configuration for a single port. So if you select multiple ports you will get one configuration file for each port.

If you want to save multiple port configurations to a single file please refer to the following section regarding testbed configurations.

Note that you do **not** have to reserve the port in order to save its configuration.

### Restoring Port Configurations

You can subsequently restore a port configuration from a saved configuration file. This means that all existing configuration on that port will be replaced with the saved configuration.

To restore a port configuration for a port you simply right-click on the port and select **Restore Port Configuration**. You will then be asked for a filename and location for the configuration file.

You can also select multiple ports and select to restore their configuration from a single file. Please see the next section for information about issues when restoring a configuration to another port than it was saved from.

Note that you will have to reserve the port in order to restore its configuration.

### Moving a Port Configuration

It is possible to load a port configuration on a different port than the one it was saved from.

If the port type of the new port is the same as the original port the operation is generally trivial. If the two ports are different certain port parameters may fail to load on the new port but this will not prevent the remaining parameters to load. The XenaManager-2G will inform you about any failing parameters.

### MAC and IP Address Issues

The port MAC address and IPv4/IPv6 addresses are all saved as part of the port configuration. So if you load a port configuration from a different port you will thus also assign the MAC and IP addresses of the old port to the new port. Usually this is not what you want so the XenaManager-2G will warn you about this and ask you what you want to do. You will then be given the option to preserve the original addresses of the new port.

## TID Issues

The various streams created on a port is also saved in the port configuration. This also includes the Test ID (TID) integer value for each stream. In most test scenarios it is important to have a unique TID value for each stream, at least inside a single testbed. Otherwise you will not be able to determine the source stream of a packet when it is received on a port.

If you load a port configuration from a different port then all streams from the original port will thus be recreated on the new port **including** the TID value assigned to the original streams. This may not be what you want so the XenaManager-2G will ask you how you want to handle this. You will be given the option to either use the original value or to assign a new unique value to the new streams.

## IP Address Issues

If the streams defined in the port configuration contain an IP protocol segment the **Source IP Address** field in the protocol header will usually be set to the assigned port IP address. The XenaManager-2G will ask you if you want to modify the protocol header fields to indicate the IP address of the new port or if you want to retain the original protocol header value.

### Working With Testmodules

From Xena software release 65 it is also possible to save and load test module configurations. This can be useful if the test module configuration affects the test port type and number (as it does for the 100G test modules) or if you are using the External Clock Sync function to synchronize the date and time across several test chassis.

The module configuration will be saved to a file with extension \*.xmc (Xena Module Configuration). The operations are similar to the saving and loading of port configurations as described above.

### Working With Testbeds

In the previous section we described how to save and restore individual port and module configurations. In this section we will describe how you can save a number of configurations to a single file. This file is called a **testcase file** and will have either extension \*.xtc (old legacy format) or extension \*.xtc2 (new format).

This function works in the context of a testbed, i.e. it works for the ports that are included in the testbed plus the parent testmodules for those ports.

## Saving Testbed Configurations

You can save the configuration for all the ports in your testbed by using the **Save Testcase** menu item in the **Operations** menu.

You will then be asked to enter a filename for the saved configuration. The default name will be the testbed name.

You can then select the format version for the saved configuration file. You can choose between these options:

- New format version (\*.xtc2) which also support saving of the parent module configurations.
- Old (v1) format (\*.xtc) which only support saving the port configurations.

If you choose the new format version you will be asked if you also want to save the parent module configurations in the testcase. You should choose this if your port configuration requires a certain module configuration.

### Restoring Testbed Configurations

You can restore a full testbed configuration by using the **Load Testcase** menu item in the **Operations** menu.

Note that the restore operation expects that all chassis, modules and ports which was involved in the original configuration save operation are still present. You cannot restore a testbed to a different set of chassis, module and/or ports.

# BASIC FEATURES

## PANEL OVERVIEW

This section contains a brief description of the various panels in the XenaManager-2G application.

### General Purpose Panels

#### Start

This panel is the default visible panel when you start the XenaManager-2G for the first time. It contains a short Getting Started guide for the application. You can close this panel once you don't feel you need it anymore.

#### Available Resources

This panel displays the resources (modules, ports and streams) for all configured chassis in your current configuration.

#### Communication Trace

This panel displays the raw detailed realtime communication with the chassis. It is mainly used for debugging the communication in case of problems but it can also be used as a help for users who wants to write automation scripts.

### Selected Resource Panels

#### Resource Properties

This panel will enable you to view and modify properties for the resource currently selected in the Available Resources tree view (chassis, module, port or stream).

#### Port Statistics

This panel will display statistics counters for the port currently selected in the Available Resources tree view, including statistics for all streams on that port.

#### Filters

This panel will enable you to configure filters for the port currently selected in the Available Resources tree view.

#### Capture

This panel will enable you to configure capture settings for the port currently selected in the Available Resources tree view.

## Histograms

This panel will enable you to configure histograms for the port currently selected in the Available Resources tree view.

## Testbed-Centric Panels

### Port Configuration Grid

This panel will enable you to view and modify properties for all ports in your testbed.

### Stream Configuration Grid

This panel will enable you to view and modify properties for the streams configured on all ports in your testbed.

### Global Statistics

This panel will display statistics counters for all ports in your testbed and also for all streams on those ports.

### Statistics Counter Charting

This panel will enable you to plot various statistics counters for selected streams.

### Statistics Logging

This panel enables you to enable periodic logging of counters from your testbed ports.

### Event Log

This panel enables you to monitor logged events for the test ports.

## AVAILABLE RESOURCES PANEL

### Testbed Selector

The testbed selector is located at the top of the panel. This functionality is explained in more detail [in this section](#).

### Resource Tree View

All available chassis resources are shown in the hierarchical tree view below the testbed selector. Each connected chassis is shown at the top-level with their contained resources below. The content of certain of the other panels depend on the selection state of the **Available Resources** panel.

<input type="checkbox"/> Show Only Used Ports <input checked="" type="checkbox"/> Reserve Used Ports			
<input checked="" type="checkbox"/> Expand All <input type="checkbox"/> Collapse All			
Name	Used		Owner
▲ Chassis 0 'XB live demo' (1)

▶ Module 3 'M2SFP+'			
▶ Module 4 'M1CFP100'			
▶ Module 6 'M6SFP'			
▲ Module 7 'M6SFP'			
▲ Port 0 'SFP-E 10/100/	<input checked="" type="checkbox"/>	<input checked="" type="radio"/>	mikkelx2
Stream 0/2			
Port 1 'SFP-E 10/100/	<input checked="" type="checkbox"/>	<input checked="" type="radio"/>	mikkelx2
Port 2 'SFP-E 10/100/1)	<input type="checkbox"/>	<input type="radio"/>	
Port 3 'SFP-E 10/100/1)	<input type="checkbox"/>	<input type="radio"/>	

## Toolbar Options

The toolbar at the top of the tree view provides quick options for viewing and reserving the resources.

### Show Only Used Ports

Toggles between showing all available resources on all connected chassis or only the ports that you have chosen to include in your testbed.

### Reserve Used Ports

Reserve all ports that you have included in your current testbed.

### Release All My Resources

Releases all resources (chassis, modules and ports) that you may have reserved. This option may only be visible when you click the small down-arrow at the right of the toolbar.

## Tree View Columns

The tree view contains the following columns:

Column	Explanation
Name	The unique name of the resource
Used	Indicates whether the resource is used by the current testbed. This column is only valid for testports.
(unnamed)	Contains icons representing the current sync (green: SYNC, red: NO SYNC) and traffic state (grey: traffic OFF, yellow: traffic ON) for a testport.
Owner	Username of the current owner of the resource, i.e. the user who has currently reserved the resource.

## Multiple Selections

It is possible to operate on multiple resources in the tree view using the standard Windows [Shift-Click] or [Ctrl-Click] mouse operations.

## Right-click Options

Each resource in the tree view supports a right-click menu, which contains various actions which are valid for the current resource state and type.

## RESOURCE PROPERTIES (CHASSIS, MODULE, PORT, STREAM)

This section describes the common XenaManager-2G **Resource Properties**.

### Viewing Resource Properties

The **Resource Properties** section provides a detailed view of all properties for a specific resource (chassis, module, port or stream). To view the properties for a given resource you must select the resource in the **Available Resources** tree view.

The properties are grouped together according to their functional area relation.

The page can display properties for a single resource at a time. If you want to view multiple ports or streams at the same time please refer to the **Port Grid or the Stream Grid sections**.

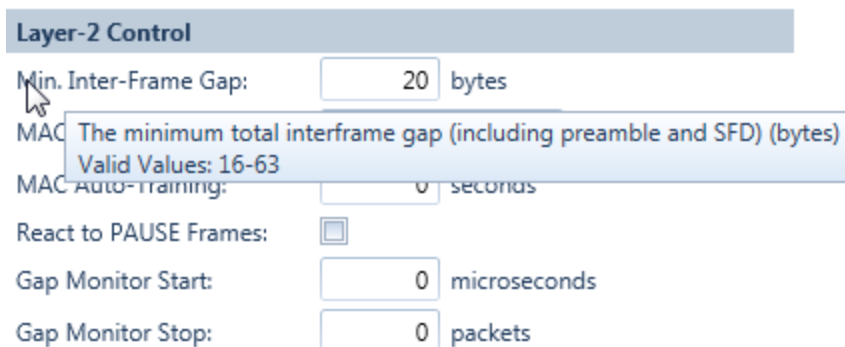

### Editing Properties

In order to change properties for a resource you need to reserve the resource first.

Note that certain properties may be disabled depending on the state of the resource. Most port and stream properties will for instance be disabled when traffic is active on the port.

### Property Tooltip

Each property edit control is prefixed with a descriptive label. If you hover the mouse over the label an even more descriptive tooltip will be displayed.

**Layer-2 Control**

Min. Inter-Frame Gap:  bytes

MAC The minimum total interframe gap (including preamble and SFD) (bytes)  
Valid Values: 16-63

MAC Auto-Training:  seconds

React to PAUSE Frames: ☐

Gap Monitor Start:  microseconds

Gap Monitor Stop:  packets

If the property only accepts values from a specific value range the tooltip will also show this information.

### Type-Specific Properties

The following links contain detailed property descriptions for the specific resource types.

- [Chassis Properties](#)
- [Module Properties](#)

- Port Properties
  - **Basic Port Properties**
  - **40/100G Properties**
  - **Transceiver Registers**
  - **Advanced PHY Features**
- **Stream Properties**

## PORT STATISTICS

This section describes the XenaManager-2G port statistics page. The page displays statistics information for the currently selected port and all streams defined on that port.

The page will only display data for a single port at a time. If you want to monitor statistics data for multiple ports at a time please refer to the **Global Statistics** section.

### Port Transmit Statistics

This area contains statistics for all data transmitted by the port.

Port Transmit Statistics <span>⚡ Clear TX Counters <input checked="" type="checkbox"/>  Mark  Save</span>			
Counter Type	Rate Percent	Bit Rate	Packet Rate
▶ Stream Traffic			
▲ Totals			
Total traffic for port	0.000	0	0
Without test payload	0.000	0	0

### Commands in TX Toolbar

The area contains a toolbar with the following commands:

Command	Explanation
<i>Clear TX Counters</i>	Clear the current TX statistics counters for this port.
<i>(checkbox)</i>	If checked the TX statistics counters for this port will be affected when the <b>Clear Statistics</b> command is executed in the <b>Global Statistics</b> panel.

<i>Mark</i>	Set the font color of the current counter values to gray. Any counter value that changes afterwards will revert to blue. This makes it easy to check if a value changes over time.
<i>Save</i>	Allow you to save the current counters to a CSV text file.

## Main Transmit Statistics

Statistics Type	Explanation
<i>Total Traffic for Port</i>	This row show statistics counters for all traffic transmitted on the port regardless of type. This is the sum of the traffic sent without test payload and the traffic sent for each active stream.
<i>Without Test Payload</i>	This row show statistics counters for the part of the transmitted traffic that is sent without test payload.
<i>Stream Traffic</i>	This branch contains a row for each stream currently active on the port.

## Error Injection

This section show the number of errors manually injected by the user for each possible error type.

## Miscellaneous Control

This section show the number of transmitted ARP/NDP and PING requests and replies, MAC training packets and IGMP Joins.

## Rort Receive Statistics

This area contains statistics for all data received by the port.

## Commands in RX Toolbar

The area contains a toolbar with the following commands:

Command	Explanation
<i>Clear RX Counters</i>	Clear the current RX statistics counters for this port.

<i>(checkbox)</i>	If checked the RX statistics counters for this port will be affected when the <b>Clear Statistics</b> command is executed in the <b>Global Statistics</b> panel.
<i>Mark</i>	Set the font color of the current counter values to gray. Any counter value that changes afterwards will revert to blue. This makes it easy to check if a value changes over time.
<i>Save</i>	Allow you to save the current counters to a CSV text file.
<i>Calibrate Latency</i>	When pressed the current average latency value will be saved as the calibrated latency offset.
<i>Poll Always</i>	Normally a port is only polled for statistics counters when it is visible in a statistics panel, such as this panel or the <b>Global Statistics</b> panel. But if you want the port to be polled always you can check this box. This function can be useful if you want to monitor the state of the port over a long period of time.

## Main Receive Statistics

Statistics Type	Explanation
<i>Total Traffic for Port</i>	This row show statistics counters for all traffic received on the port regardless of type. This is the sum of the traffic received without test payload and the traffic received for each TID.
<i>Without Test Payload</i>	This row show statistics counters for the part of the received traffic that is sent without test payload.
<i>Filter Traffic</i>	This branch contains a row for each active filter on the port.
<i>Test Payload Traffic</i>	This branch contains a row for each TID received on the port.

## Test Payload Specific Counters

A number of sections show counters received for each TID:

Counter Type	Explanation
<i>Test Payload Errors</i>	This section contain a row for the payload errors received for each TID on the port.
<i>Test Payload Latency</i>	This section contain a row for the payload latency measured for each TID on the port.
<i>Test Payload Jitter</i>	This section contain a row for the payload jitter measured for each TID on the port.

## Misc. Counters

This section show statistics for various other counter types.

Counter Type	Explanation
<i>Arp Req.</i>	Received ARP/NDP requests
<i>Arp Repl.</i>	Received ARP/NDP replies
<i>Ping Req.</i>	Received PING requests
<i>Ping Repl.</i>	Received PING replies
<i>FCS Errors</i>	Received packets with FCS errors
<i>PAUSE</i>	Received PAUSE frames
<i>Gap Count</i>	Number of gap counts detected
<i>Gap Dur.</i>	Current detected gap duration

## PORT AND STREAM CONFIGURATION GRIDS

This section explains how to use the port and stream configuration grids.

### Overview

The port and stream configuration grid pages are somewhat similar in their function and they are thus described together in this section.

### Port Configuration Grid

The Port Configuration Grid show all ports currently in your testbed. It does not show any other ports, not even if they have been reserved by you.

For a more detailed description of each port property please refer to the [Port Properties](#) page.

### Stream Configuration Grid

The Stream Configuration Grid show all streams for ports that meet the **Stream Source** selection criteria. It does not show streams for any other ports, not even if they have been reserved by you.

The default criteria is **All Ports In Testbed** which is the same criteria as is used for the Port Configuration Grid. You can however change the criteria using the dropdown box in the local toolbar to **Currently Selected Port(s)**. This will only show streams for the ports you have selected in the **Available Resources** tree view.

For a more detailed description of each stream property please refer to the [Stream Properties](#) page.

### Accessing the Packet Header Editor

It would be unrealistic to display all possible protocol segment fields in the grid. We have chosen to display a few commonly used fields. For the rest you can access the **Packet Header Editor** [described on this page](#) by clicking on the “plus” sign at the start of the row. The Packet Header Editor will then expand below the grid rows as shown in the image below.

## Common operations

### Column Filtering

Each grid contains a lot of columns which may slow down the loading of the grid and/or may “overload” your visibility. This section explains how you can limit the number of displayed columns and select which columns you want to be shown.

#### Show Read-Only Columns

The toolbar contains a checkbox which toggles the visibility of the read-only columns. This is useful if you only want to show columns that actually allow you to configure something.

#### Set Column Filters

If you want more control over the displayed columns you can press the Set Column Filters button in the toolbar. This will allow you to filter the columns either based on their group or individually. The filter selections will be remembered the next time you start up the XenaManager-2G.

### Frozen Columns

The first set of columns that uniquely identifies the entity in each row will be “frozen” which means that they will not scroll out of view even if you scroll the columns all the way to the right.

### Right-click Operations

Each cell in the grid may support one or more of the right-click actions described below.

#### Use Value for All

If this action is selected the value for this cell will be used for all the other rows.

#### Use Value for All w.Increment

If this action is selected the value for this cell will be used as a template value for all the other rows, but it will be incremented for each row. The increment will be performed based on the value type. A rate value of e.g. 11.4 will be incremented to 12.4. An IP address of 10.0.0.4 will be incremented to 10.0.0.5.

## GLOBAL STATISTICS

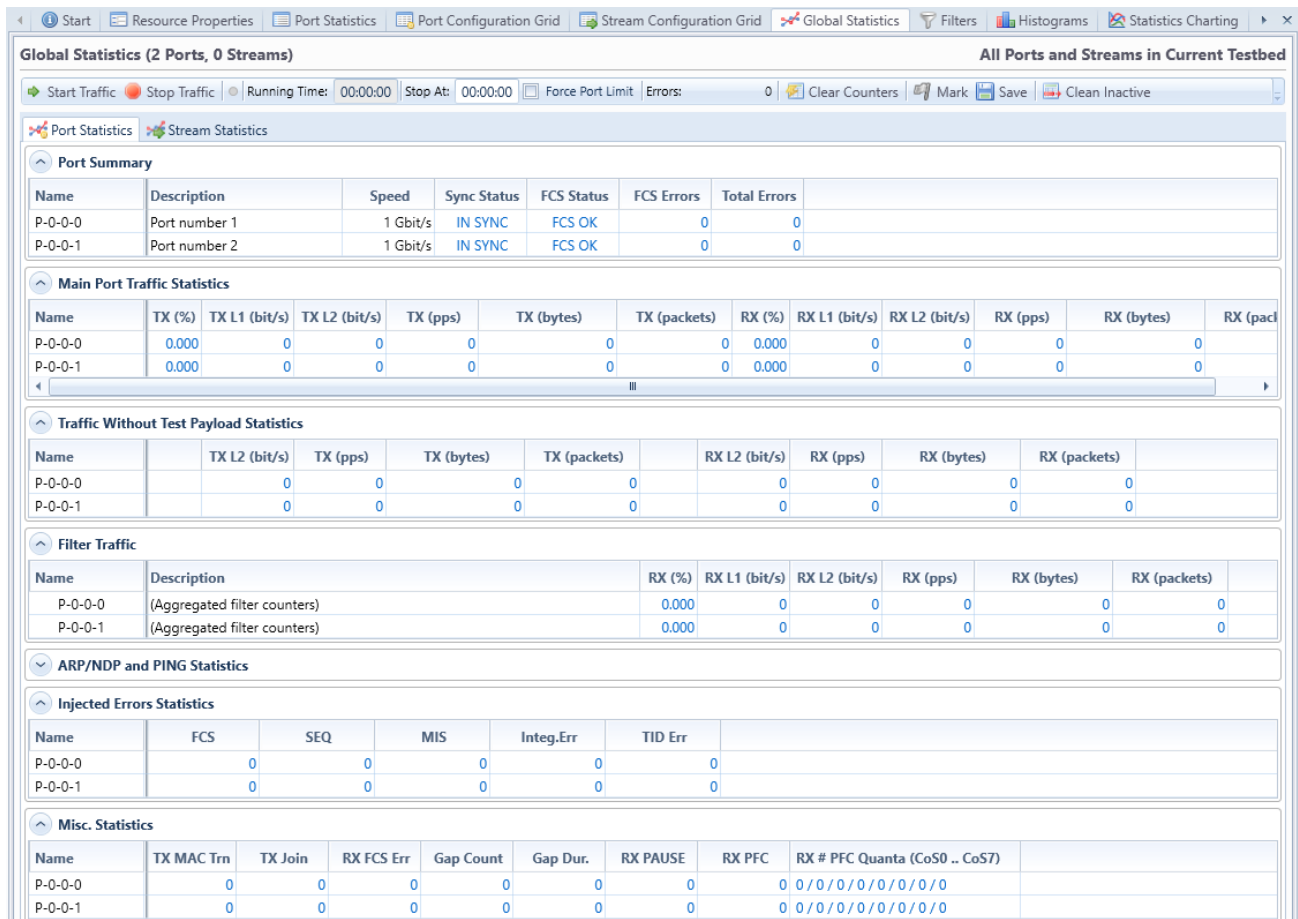

This section describes the XenaManager-2G Global Statistics panel.

### Overview

The Global Statistics panel show all ports and streams currently in your testbed. It does not show any other ports (or streams on these ports), not even if they have been reserved by you.

### Statistics Tabs

The panel is divided into two tabs. The first tab show testbed-global **Port Statistics** and the other show testbed-global **Stream Statistics**.

The screenshot displays the 'Global Statistics (2 Ports, 0 Streams)' window. The 'Port Statistics' tab is active, showing various statistics for two ports: P-0-0-0 and P-0-0-1. The window includes a toolbar with buttons for Start Traffic, Stop Traffic, Running Time, Stop At, Force Port Limit, Errors, Clear Counters, Mark, Save, and Clean Inactive. The main content area is divided into several sections: Port Summary, Main Port Traffic Statistics, Traffic Without Test Payload Statistics, Filter Traffic, ARP/NDP and PING Statistics, Injected Errors Statistics, and Misc. Statistics. Each section contains a table with relevant data for the two ports.

Name	Description	Speed	Sync Status	FCS Status	FCS Errors	Total Errors
P-0-0-0	Port number 1	1 Gbit/s	IN SYNC	FCS OK	0	0
P-0-0-1	Port number 2	1 Gbit/s	IN SYNC	FCS OK	0	0

## Common Toolbar Functions

The two statistics tabs share a common toolbar with the following functions:

Function	Explanation
<i>Start Traffic</i>	<p>Start traffic on all ports in your testbed. Ports that are already transmitting are not affected.</p> <p>This command may also affect any capture and histograms defined for the ports if you have enabled it.</p>
<i>Stop Traffic</i>	<p>Stop traffic on all ports in your testbed. Ports that are not transmitting are not affected.</p> <p>This command may also affect any capture and histograms defined for the ports if you have enabled it.</p>
<i>Running Time</i>	<p>Show the amount of time that has elapsed since you performed a <b>Start Traffic</b> command in this panel. If an individual port had been started before this point in time this is not reflected in the <b>Running Time</b> value.</p>
<i>Stop At</i>	<p>Allow you to specify a time limit for the port transmission. When the <b>Running Time</b> exceeds this value the port traffic will be automatically stopped.</p>

<i>Errors</i>	Display the total number of errors on all ports in your testbed.
<i>Clear Counters</i>	Clear the current statistics counters for all streams on all ports.
<i>Mark</i>	Set the font color of the current counter values to gray. Any counter value that changes afterwards will revert to blue. This makes it easy to check if a value changes over time.
<i>Save</i>	Allow you to save the current counters to a CSV text file.

## Common Column Header Functions

The two statistics tabs also share a common functionality w.r.t. the grid column headers.

You can reorder the columns in the grid by dragging a column header to a new location. The new order will be remembered the next time you start XenaManager-2G.

The following options are available when right-clicking on the grid column headers:

Function	Explanation
Hide Column:	Hide the selected column from view. This selection will be remembered the next time you start XenaManager-2G.
Reset Column Order:	Resets any custom column order you may have configured to the default order.
View All Columns:	Show all columns you may have hidden previously.

## Port Statistics

The Port Statistics tab show statistics counters for all ports in your testbed. In general each port is represented by a single row which contain both Tx and Rx counters for that port.

## Port Summary

The Port Summary section provides a brief overview of the main port state properties for the testbed ports.

## Traffic Statistics Counters

The available statistics counters for each port are the same as for the individual port statistics page [described here](#).

## Stream Statistics

The Stream Statistics tab show statistics counters for all streams on all ports in your testbed. Each counter type is explained in the individual port statistics page [described here](#).

## TID Matching

The counters are shown in a grid view where each row represent both ends of a stream. The stream “ends” are matched together using the Test Payload ID (TID) which is configured on the stream at the transmit end and transferred to the received end within the Xena test payload inside each packet.

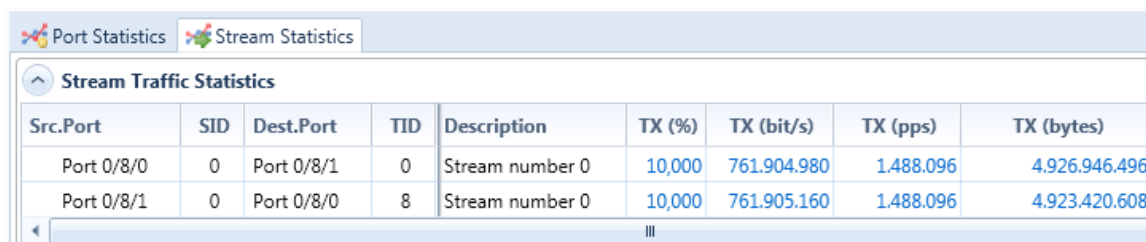

To enable an accurate matching of Tx and Rx stream ends it is imperative that the used TID values are unique within the testbed. Otherwise it will be impossible to determine which stream on which port was the sender of a given packet.

## Aggregated Stream Statistics

This section show the aggregated counter values for all streams in the view.

## Stream Traffic Statistics

This section show the main stream traffic counters for each stream.

Src.Port	SID	Dest.Port	TID	Description	TX (%)	TX (bit/s)	TX (pps)	TX (bytes)
Port 0/8/0	0	Port 0/8/1	0	Stream number 0	10,000	761.904.980	1.488.096	4.926.946.496
Port 0/8/1	0	Port 0/8/0	8	Stream number 0	10,000	761.905.160	1.488.096	4.923.420.608

Each row in the grid represents a test-stream end-to-end. The stream entity is identified by the TID value. The Tx counter values are read from the transmitting port and the Rx counter values are read from the receiving port.

## TID Conflicts

If two or more streams in your testbed use the same TID value the Stream Statistics grid will not be able to accurately determine where the various TID contributions originate from on the receiving side. The grid will show this situation as a single parent row representing all receive-side contributions from the given TID value. The transmit-side contributions will be shown as **N/A**. The source port will be shown as **Multiple** (see example below).

Bit Error  
Rate

This value is an estimated bit error rate (BER) measured over the timespan since the traffic counters was last cleared.

The BER value provided is estimated based on the assumption that 1 errored packet equals 1 bit error. If more than one bit error occurred in one errored packet this will not be detected by the Xena tester. Based on this assumption the estimated BER is calculated as follows by the XenaManager:

sumErrors = lostPackets + misorderPackets

$BER = 1.0 / (8.0 * rxBytes / sumErrors)$

## Latency and Jitter

The **Latency and Jitter** section show the latency and jitter values calculated for each end-to-end stream entity. The mechanism for showing TID conflicts explained above is also used here.

## PORT FILTERS

This section describes the XenaManager-2G **Filters** panel. The panel allows you to configure the filters for the currently selected port.

### Overview

Every port has a filter mechanism for inspecting all the received packets and recognizing particular patterns within the packets. Filters are defined under their own “Filters” panel in the content area of the XenaManager. Filters are independent of the test payloads and provide an alternative method for analyzing the train of received packets.

**Filter Definitions**
**XB live demo /**

➕ Add Match Term
➖ Remove Match Term
➕ Add Length Term
➖ Remove Length Term
➕ Add Filter
➖ Remove Filter

**Match Terms**

Match ID	Segment/Field Type	Segment/Field Selector	Position	Filter Mask	Filter Value
M0	Ethernet - DMAC Address	Select Field	0	FF 00 00 00 00 00	00 00 00 00 00 00

**Length Terms**

Length ID	Length Type	Length	
L0	At Most	100	Remove

**Filters**

Index	Enabled	Description	Filter Condition
0	<input checked="" type="checkbox"/>	Filter number 0	M0 & L0

Filters are logical conditional expressions on a number of basic true-or-false terms, which can be of two types: **match terms** and **length terms**.

- Match terms look for a particular pattern of bits at a particular position within each packet.
- Length terms look for packets that are longer or shorter than a particular size.
- A number of these two terms can then be combined into a single filter condition.

### Filter Details

#### Match Terms

As stated above match terms look for a particular pattern of bits at a particular position within each packet. Like a modifier, a match term will typically correspond to a particular protocol field.

And like a modifier you can select the protocol field where you want to position the filter. However, since a filter is not related to any stream definition you need to manually click the “Add” button to build the needed protocol segments.

Match terms also consist of a filter mask and a filter value. The mask indicates which part of the value you want to match on. The filter value is the actual value you want to match on.

A match term is identified with the code “M<index>” where <index> is a non-negative integer identifying the match term.

#### Length Terms

As stated above length terms look for packets that are longer or shorter than a particular size. If you want to look for packets that fit within a certain range you will need to define two length terms; one that looks for packets larger than or equal to the minimum size (At Least) and one that looks for packets smaller than or equal to the maximum size (At Most).

A length term is identified with the code “L<index>” where <index> is a non-negative integer identifying the length term.

#### Filter Condition

Each filter consist mainly of a filter condition that combines one or more match terms and one or more length terms. The filter condition is built using a boolean expression using the match and length term identifiers names. The condition can use the usual Boolean operators &, |, and ~. The | operator has the lowest precedence.

Example: M0 & L0 & ~M1 (means “match M0 but not M1 and also fulfill L0”)

#### Using Filters

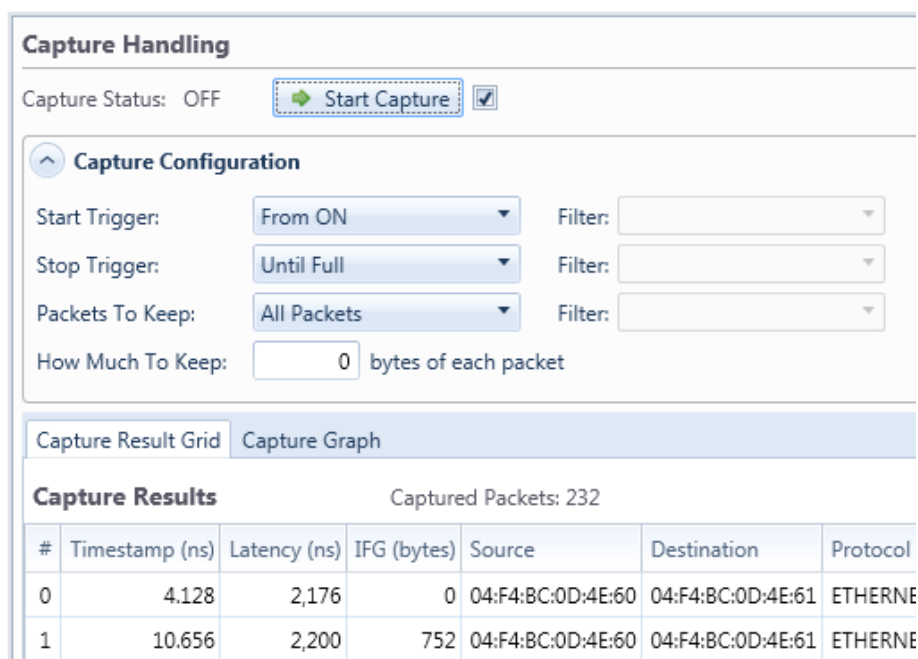

Filters can be used in different ways: the port will accumulate separate statistics for packets satisfying the filter condition, the capture mechanism can use the filters as start/stop/keep criteria, and likewise for the histogram mechanism.

## PORT CAPTURE

This section describes the XenaManager-2G **Capture** panel. The panel allow you to configure the capture settings for the currently selected port and to inspect the result of the capture.

### Overview

All packets arriving at a port are counted and analyzed if they contain test payloads. In addition, selected packets can be retained (captured) for closer inspection using the capture mechanism.

The screenshot shows the 'Capture Handling' panel in XenaManager-2G. It includes a 'Capture Status' section with a 'Start Capture' button and a checkbox. Below is the 'Capture Configuration' section with dropdowns for 'Start Trigger' (From ON), 'Stop Trigger' (Until Full), and 'Packets To Keep' (All Packets), each with an associated 'Filter' field. A 'How Much To Keep' field is set to 0 bytes. At the bottom, there are tabs for 'Capture Result Grid' and 'Capture Graph'. The 'Capture Result Grid' is active, showing a table of captured packets with 232 total packets.

#	Timestamp (ns)	Latency (ns)	IFG (bytes)	Source	Destination	Protocol
0	4.128	2,176	0	04:F4:BC:0D:4E:60	04:F4:BC:0D:4E:61	ETHERNE
1	10.656	2,200	752	04:F4:BC:0D:4E:60	04:F4:BC:0D:4E:61	ETHERNE

### Configuration

#### Start Trigger

The Start Trigger control when the capture function actually begin to collect packets in the capture buffer. The default behavior is to begin collection when capture is started (aka. the From ON option). Other options include:

- *From FCS Error*: Begin collection when the first FCS error in a received packet is detected.
- *From Filter*: Begin collection when the first packet that matches the specified filter is received.
- *From Payload Error*: Begin collection when the first payload error in a received packet is detected.

#### Stop Trigger

The Stop Trigger can be used to control when the capture function stops collecting packets. When using a start trigger, capturing is automatically stopped if the internal capture buffer runs full. When using only a stop trigger, the hardware capture buffer retains as many packets as possible up until the stop trigger event.

The Stop Trigger options are identical to the Start Trigger options.

#### Packets To Keep

This option control what type of packets to keep. This may help you make the most of the limited

capture buffer.

### How Much To Keep

This option how much of the captured packets to keep. Using this option will increase the number of packets you can keep in the internal capture buffer. The XenaManager will always report the total length of the packet even if it has been truncated due to this option.

### Starting Capture

You can manually start capture on a port by pressing the **Start Capture** button at the top of the panel. If the checkbox next to the button is checked the Global Statistics **Start Traffic** button will also start capture of the ports in your testbed.

### Capture Results

The captured packets will be uploaded from the chassis while capture is ongoing. You can thus inspect them both when the capture is still in progress and when the capture operation has completed.

### Results Grid

Each captured packet will be displayed as a row in the **Result Grid**. The following values are reported for each packet:

- *Timestamp*: The timestamp for when the packet was received relative to capture start.
- *Latency*: The latency value calculated from the Xena test payload data (not valid for other types of packets)
- *IFG*: The Inter-Frame Gap compared to the previous packet.
- *Source*: The SMAC address from the packet.
- *Destination*: The DMAC address from the packet.
- *Protocol*: A summary of the decoded packet headers in the packet.
- *Full Length*: The original length of the captured packet before any optional truncation due to the **How Much To Keep** option has been performed.
- *Captured Length*: The actual length of the captured packet after optional truncation.

If you select a packet in the grid a Wireshark-like packet header view will be displayed below the grid where the packet content can be inspected.

### Capture Graph

The XenaManager also provides a graphical histogram view of the length or spacing of the captured packets, as well as the latencies.

### Saving or Exporting Capture Data

By using the **Save Packets** button you can save the captured packets to a PCAP or a PCAP-NG (PCAP Next Generation) file.

You can also launch Wireshark directly with the captured packets as an argument by pressing the **Launch Wireshark** button. This obviously require that Wireshark has been installed on your PC.

## PORT HISTOGRAMS

This section describes the XenaManager-2G **Histogram** panel. The panel allow you to configure the histogram settings for the currently selected port and to inspect the result of the histograms data collection.

### Overview

Histograms analyze a stream of packets, either at the transmit side or the receive side of a port, and classify them into a number of buckets, counting how many packets go into each bucket.

A histogram is configured with a fixed number of buckets and a value range. The first and last bucket handles all the packets that don't fit within the specified range. All the other buckets each handle a sub-span of the range, determined by the histogram configuration.

Histograms complement the statistics counters function, which just provide aggregate counts, and the capturing function, which provides per-packet information.

### Configuration

You can create up to two histograms per port. Usually a single histogram will be sufficient for most uses. You can add a new histogram by pressing the **Add Histogram** button in the toolbar. To delete a histogram you should select the histogram and press the **Remove Histogram** button in the toolbar.

Each histogram is listed as a row in the configuration gridview and has the following configuration properties:

- *State*: Indicates whether the histogram is currently activated or not.
- *Control*: Allow you to control the activation state of the histogram.
- *Global?*: Allow histogram control from Global Statistics view.
- *Source Type*: Determines what type of metric is used as the source for the histogram.
- *Which Packets*: Control which type of packets are used for the histogram.
- *TID*: If the *Which Packets* property is set to **Test Payload** this field should contain the Test Payload ID (TID).
- *Filter*: If the *Which Packets* property is set to **Filter** you should select the filter you want to use here.
- *Start*: The lowest value in the valid range. Any value lower than this will be placed in the first bucket.
- *Step*: The span of each bucket.

### Histogram Results

#### Viewing Charts

Once a histogram is active you can view the realtime chart of the collected data by selecting the histogram row. When a histogram is activated all the buckets are empty. As packets are encountered (according to the source) their data is registered and placed in the correct bucket

according to the range specification. You can see this progress in the chart.

Hovering the mouse over a particular vertical bar pops up a little window with the information about that bucket as shown in the image below. The **Accumulated** value indicates the sum of the values up to and including the value in focus.

You can temporarily freeze the chart update by pressing the **Freeze Chart** button. No data will be lost and when you unfreeze the chart it will be updated with all the samples that was collected in the background.

You can use the chart scrollbars to zoom and pan the results [as described on this page](#).

### Saving Results

The bucket counts can also be saved to a CSV textfile file for more detailed analysis by pressing the **Save Data** button.

## PORT GAUGES/METERS

This section describes the XenaManager-2G **Gauge/Meter** window. The window allows you to display the layer 2 traffic for a port or a stream in a Gauge (or Meter).

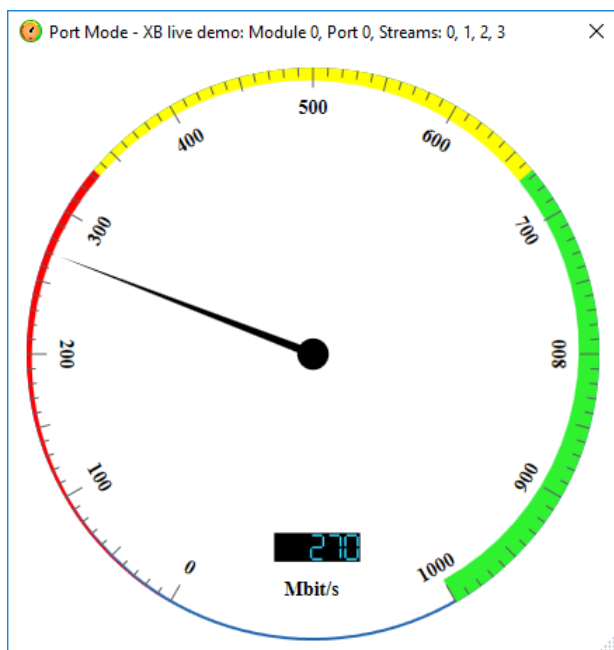

### Overview

Gauges display the current layer 2 traffic in bit/s for a port or a stream for a quick visual overview of one or more traffic results. The gauge transforms the layer 2 traffic into the visual representation of the gauge and will display the numerical value in the same window. The gauge auto scales to the bit rate of the port carrying the monitored traffic.

### Configuration

You can activate gauges when traffic is running. To activate a gauge for a port or a stream, right-click on the port or stream in the Available Resources tree in the left side of the XenaManager-2G. You now get a menu with options for the port/stream, including **Add Gauge**. When you click **Add Gauge**, the Gauge window will appear. You can continue to add more gauges to show information for the ports and streams that are relevant to you.

At the top of the Gauge window you can see if the gauge shows traffic for a port (Port Mode) or a stream (Stream Mode). You will also find identification of chassis, module, port and stream(s). If you left-click and hold on the top line in the gauge window, you can move it around on your PC screen.

You can resize the gauge window by dragging in the low right corner of the window.

### Keyboard Resizing Shortcuts:

- + Doubles the gauge window size.
- Restores the gauge window size.

### Gauge Menu

If you right-click on the gauge window you get the Gauge Menu:

- *Restore Size*: Restores the size of the gauge window to its default size
- *UI Theme*: Allow you to change the appearance of the gauge.
- *Refresh Rate (ms)*: Allow you to select how often the gauge is updated.

To close the gauge window, click on the X in the top left of the gauge window or press Alt+F4. The gauge window will automatically close when the traffic it monitors is stopped or the XenaManager-2G is closed.

## EVENT LOG

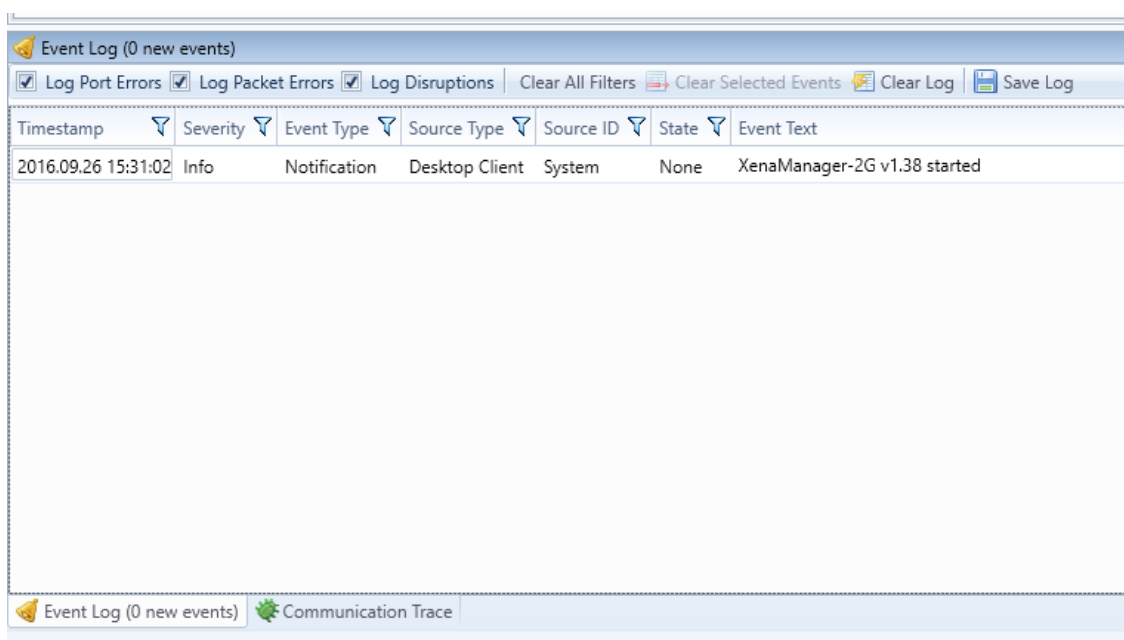

This section describes the XenaManager-2G **Event Log** panel. This panel can be used to view events from all connected ports.

### Event Types

The Event Log displays events of the following types:

- Port Errors: Indicate an error that affects the operation of the whole port.
- Packet Errors: Indicate an error in a received packet.
- Disruption: Indicate that the port-level gap monitor has detected a gap in the received data stream.

You can control the logging of each of these types in the Event Log panel toolbar, as indicated below:

### Event States

Some events are raised when a monitored value crosses a certain threshold and cleared when the monitored value falls below the threshold again. This includes for instance the port sync state and the laser Rx level events and the disruption events.

Other events are merely raised when a certain criteria is met. This includes for instance the packet error events. These events are not cleared.

### Event Monitoring

For detection of most event types the port needs to be polled continuously. It is only the port sync event that can be detected without polling.

However to decrease the performance impact of too much polling the XenaManager-2G will by default only poll ports that are visible in a panel that requires the polled information. This primary includes the various statistics panels. So if you are currently not viewing e.g. the statistics panel for

a given port the port may not be polled.

If you require a given port to be polled regardless of its current visibility you can enable the **Poll Always** property in the **Port Receive Statistics** toolbar in the **Port Statistics** panel.

### Event Columns

The Event Log panel contains the following columns:

- **Timestamp:** The timestamp when the event was detected by the XenaManager-2G. Note: This does not represent the time when the event occurred in the chassis but the time when the event was detected on the PC. The accuracy is thus in the seconds range.
- **Source Type:** The type of the event source.
- **Source ID:** A unique identification of the event source.
- **State:** The event state (see above for details)
- **Event Type:** The event type (see above for details)
- **Event Text:** A textual description for the event which may provide more details.

### Event Log Management

The event log is not persistent and the content will be cleared when you close down the XenaManager-2G application.

You can save the current content of the event log to a CSV text file by clicking the **Save Log** button in the toolbar. You can also manually clear the event log by clicking the **Clear Log** button in the toolbar.

## COMMUNICATIONS TRACE

This section describes the XenaManager-2G **Communication Trace** panel. This panel shows the decoded communication with connected chassis using the Xena Management Protocol (XMP).

The panel is mainly used for debugging the communication in case of problems but it can also be used as a help for users writing automation scripts who want to see how a certain request is formatted.

For details on the XMP requests please refer to the [Scripting Manual](#).

### Trace Format

The trace entries are displayed in a standard grid view as shown below. Each request or reply is listed in a separate row in the grid. Requests sent from the XenaManager-2G are shown in green whereas successfully replies from the chassis are shown in blue. Error replies from the chassis are shown in red.

Communication Trace									
Tx: To chassis		Rx: From chassis (OK)	Rx: From chassis (Error)	Count: 11					
Time	Dir	ChassisName	Target	Command	SeqNo	Param	Arguments	Result	
17:17:08.710	Tx	XB live demo	7/0 [0]	VALUE	295	PS_ENABLE	00		
17:17:08.712	Tx	XB live demo	7/0	VALUE	296	P_SPEEDSELECTION	00		
17:17:08.716	Tx	XB live demo	7/0 [0]	VALUE	297	PS_ENABLE	01		
17:17:08.828	Rx	XB live demo	7/0	STATUS	295	PS_ENABLE		OK	
17:17:08.832	Rx	XB live demo	7/0	STATUS	296	P_SPEEDSELECTION		OK	
17:17:09.011	Rx	XB live demo	7/0	STATUS	297	PS_ENABLE		OK	
17:17:09.724	Rx	XB live demo	7/0	VALUE	0	P_RESETSYNCH	00	OK	

### Available Columns

The trace gridview offers the following columns:

- **Time**: A timestamp for the trace event with millisecond accuracy.
- **Dir**: The direction (Tx or Rx).
- **ChassisName**: Name of the chassis
- **Target**: The request target on the form *<module index>/<port index> [optional stream index]*.
- **Command**: The XMP command type
- **SeqNo**: The XMP sequence number.
- **Param**: The XMP request parameter.
- **Arguments**: Any arguments as a list of hexadecimal numbers
- **Result**: The result code for a reply.

### Filtering

Several columns provide support for filtering the displayed trace messages. This is indicated by the funnel icon in the column header. If you click this icon you can select how you want to filter the displayed trace messages.

### Performance Impact

Having the panel open at all times is usually not recommended. If a lot of traffic is going to and from the chassis this may impact the performance of the PC, especially during polling.

# ADVANCED FEATURES

## CHASSIS TIME SYNCHRONIZATION

This section describes how to setup and monitor time synchronization between multiple Xena test chassis.

---

**IMPORTANT:** This function require **additional software** installed on your Xena test chassis. Please contact **Xena support** for details.

---

### Overview

#### Capabilities

The chassis time synchronization feature enables multiple Xena testers to synchronize their local time to each other. This can be used for various purposes:

- One-Way Latency (OWL) measurements between two test chassis.
- Synchronized traffic start between multiple chassis.
- Accurate timestamping of captured packets in exported PCAP files.

The timing network consisting of your Xena testers may be configured in a very flexible way supporting multiple scenarios:

- One tester may serve time to the other testers (and any other host on your network) using any combination of NTP, PTP or RFC 868 TIME (\*).
- Each tester may obtain its own time from an external NTP, PTP or GPS source.

(\*) Note that the RFC 868 TIME protocol can only set the time with a precision of 1 second.

#### About TimeKeeper

**TimeKeeper** is an advanced time synchronization solution from the company **FSMLabs**. Xena Networks uses the TimeKeeper solution to keep the local time on each Xena test chassis in sync. The TimeKeeper solution must be installed on each Xena chassis that will participate in the timing setup.

The TimeKeeper solution runs as a separate service on the Xena chassis but is configured and monitored through the XenaManager-2G.

#### Licensing

Each Xena chassis running the TimeKeeper solution will require an additional software license. The license is time-limited and must be periodically renewed for the TimeKeeper solution to continue to

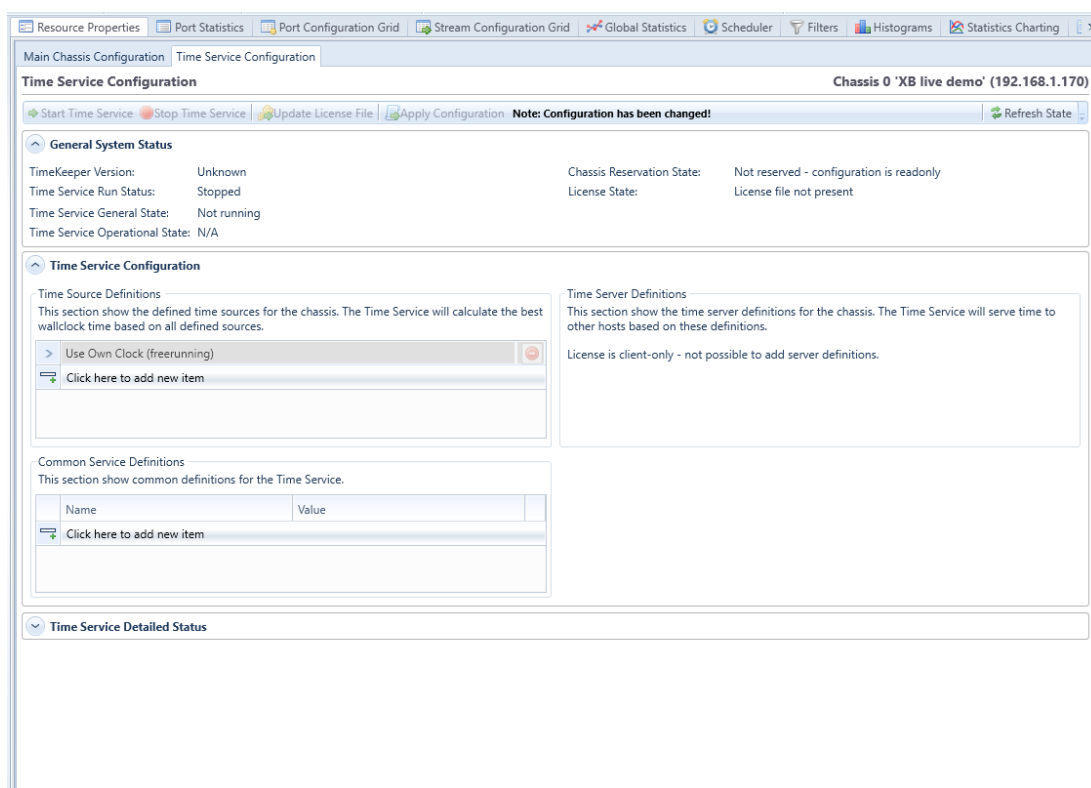

work.

The TimeKeeper license comes in two types: A *client-only license* that only allows the Xena chassis to obtain its time from an external source and a *full license* (aka. a *server license*) that also allows the Xena chassis to serve time to other hosts.

Contact [Xena sales](#) for details on the availability and pricing of the TimeKeeper licenses.

## TimeKeeper Configuration

The TimeKeeper configuration is accessed as part of the chassis resource property page. If the TimeKeeper solution is installed on the chassis an additional sub-tab named **Time Service Configuration** will be visible when you select the chassis resource property page, as shown below.

## Service and License Control

The TimeKeeper service state can be controlled by the buttons in the top toolbar:

Name	Explanation
Start Time Service	Start the TimeKeeper service if it is not already running.
Stop Time Service	Stop the TimeKeeper service if it is running.
Update License File	Upload a new TimeKeeper license file to the Xena chassis.

Apply Configuration	Apply a changed configuration for the TimeKeeper service. Invoking this option will also restart the TimeKeeper service.
Refresh State	The TimeKeeper status will be automatically refreshed every 5 seconds. You can however manually refresh the status by clicking this button.

## General State

The general state of the TimeKeeper solution can be monitored in the **General System State** section at the top. The following values are provided:

Value	Explanation
Version:	The currently installed version of TimeKeeper.
Run Status:	The current state of the TimeKeeper service (started or stopped)
General State:	The general state of TimeKeeper
Operational State:	A more detailed state of TimeKeeper
Reservation State:	The current chassis reservation state (must be reserved in order to change configuration)
License State:	The current license state (valid or invalid) and scope (client-only or full server).

## Time Source Configuration

A *time source* represents the source from which this chassis will synchronize its OS kernel time. The following source types are supported:

- An external NTP server
  - An external PTP server
  - An internal SpectraTime GPS module (an optional hardware add-on for the chassis)
- PPS device is not used.

You must configure at least one time source for a chassis. It is possible to configure multiple time sources for a single chassis. The TimeKeeper solution will extract the optimal time based on the contributions from all configured sources.

## Time Source Parameters

Parameter	Explanation	Applies To
Server Address	The address of the server to source time from	NTP Server, PTP Server
Interface	The network interface to listen on. If left empty all available network interfaces will be used.	PTP Server

## Time Server Configuration

If a Xena chassis has been provided with a full TimeKeeper server license it may also serve time to the network, including other Xena chassis in the network. You can configure several different time server definitions for a chassis.

## Time Server Parameters

Parameter	Explanation	Applies To
Interface	The network interface to send messages on. If left empty all available network interfaces will be used.	PTP Server

## License Scenarios

This section describes various configuration scenarios and the required hardware and licenses.

### Local Datacenter Scenario

If you have a number of co-located Xena testers in the same physical location and connected to the same local network you can use one of the testers as a time server. This tester will then serve time to the rest of the network, including but not limited to the other Xena testers. The best results will be obtained by using PTP between the Xena testers.

If you have N testers you will need one full TimeKeeper server license and N-1 client-only TimeKeeper licenses. You can configure the time server to synchronize to a public NTP server but if you need a very accurate local time you can optionally equip the time server tester with a SpectraTime GPS module.

[efsnofication type="" style="warning2" close="false" ]Note that the SpectraTime GPS module must be purchased and installed through Xena Networks.[/efsnofication]

## Remote Networked Scenario

If you have two or more Xena testers in remote locations which are connected to the Internet you can then use a public NTP service to synchronize each of the testers. Please note that using a public NTP server will most likely be less accurate than the other solutions.

If you have N testers you will then need N client-only TimeKeeper licenses.

## Remote Scenario (no Internet)

If you have two or more Xena testers in remote locations which are **not** connected to the Internet you can equip each tester with a GPS module.

If you have N testers you will then need N client-only TimeKeeper licenses and N GPS modules.

[efsnotification type="" style="warning2" close="false" ]Note that the SpectraTime GPS module must be purchased and installed through Xena Networks.[/efsnotification]

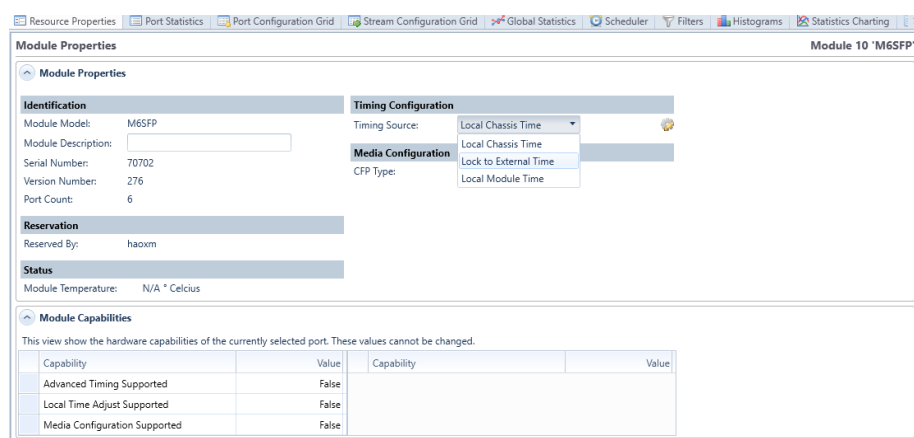

## Test Module Configuration

By default, each test module will use its own internal clock for latency timestamps and scheduling traffic start. The internal module clock is synchronized with the general PCI clock on the chassis but two or more chassis will of course not share the same clock.

## Enabling External Clock Sync

Perform the following steps to enable each test module to synchronize to the TimeKeeper-controlled Operating System (OS) kernel clock:

1. Open XenaManager-2G and reserve the test module you want to configure.
2. Set the **Latency Reference** option to “Lock to External Time”.

The module will now attempt to synchronize its internal clock to the OS kernel clock.

## Monitoring Clock Sync Accuracy

You can monitor the accuracy using the following state properties:

Name	Explanation
External Clock Diff	The currently measured difference between the OS kernel time and the local module time.
External Clock Stats	<p>Statistics counters:</p> <ul style="list-style-type: none"> <li>• AP: Number of polls when in “Adjusting” state.</li> <li>• SP: Number of polls when in “Steady” state.</li> <li>• SE: Number of state transitions to “Steady” state.</li> <li>• SS: Number of “spikes” seen when in “Steady” state.</li> </ul>
External Clock State	<p>One of the following:</p> <ul style="list-style-type: none"> <li>• Adjusting: The module clock is adjusting to the OS kernel time.</li> <li>• Steady: The module clock has been within +/- 500 nsec from the OS kernel time for the last 5 seconds.</li> </ul>

The module clock will usually synchronize to the OS kernel time with approx. 15-20 seconds. But if the OS kernel time is also being adjusted by TimeKeeper you will experience a larger adjustment period.

## DHCP CLIENT WIZARD

### Overview

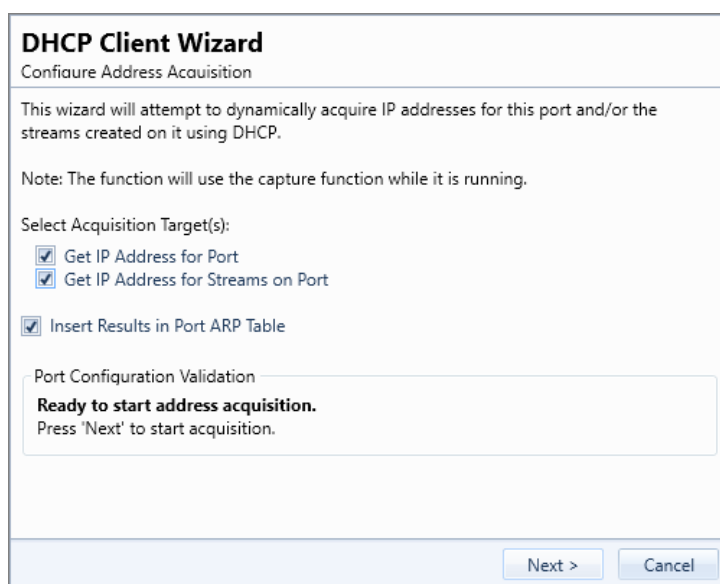

If your DUT contains a DHCP server (IPv4) you can use this to quickly assign IP addresses to your test port and/or the streams configured on the port. The addresses must be acquired from the DHCP server prior to starting the traffic. and will then be stored as part of the port and stream configuration.

At present only IPv4 is supported. Support for IPv6 may be added in the future.

### Wizard Operation

#### Selecting Targets

When you open the wizard you will be presented with the start page shown below. You can now select to acquire addresses for the port itself, the existing streams on the port, or both.

**DHCP Client Wizard**  
Configure Address Acquisition

This wizard will attempt to dynamically acquire IP addresses for this port and/or the streams created on it using DHCP.

Note: The function will use the capture function while it is running.

Select Acquisition Target(s):

- ☒ Get IP Address for Port
- ☒ Get IP Address for Streams on Port
- ☒ Insert Results in Port ARP Table

Port Configuration Validation

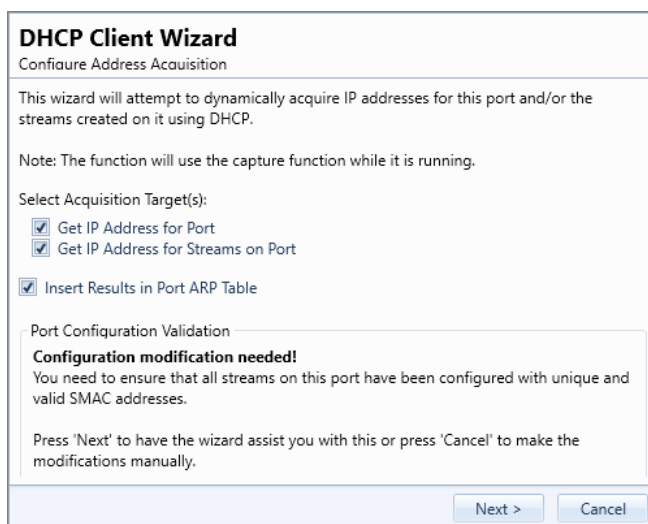

**Ready to start address acquisition.**  
Press 'Next' to start acquisition.

Next > Cancel

Please note that if you select to acquire addresses for your streams then they must all contain an IPv4 protocol segment. If the wizard detects that this is not the case you must exit the wizard and correct this manually.

#### Setting SMAC for Streams

To acquire addresses for streams each stream must be configured with a unique SMAC address in the initial Ethernet protocol segment. On initial launch the wizard will determine if the SMAC addresses for the streams are unique within the scope of the port. If not it will offer to assist you in assigning unique addresses as indicated in the screenshot shown below.

**DHCP Client Wizard**  
Configure Address Acquisition

This wizard will attempt to dynamically acquire IP addresses for this port and/or the streams created on it using DHCP.

Note: The function will use the capture function while it is running.

Select Acquisition Target(s):

- ☒ Get IP Address for Port
- ☒ Get IP Address for Streams on Port
- ☒ Insert Results in Port ARP Table

Port Configuration Validation

**Configuration modification needed!**  
You need to ensure that all streams on this port have been configured with unique and valid SMAC addresses.

Press 'Next' to have the wizard assist you with this or press 'Cancel' to make the modifications manually.

Next > Cancel

Please note that the wizard will not ensure that the stream SMAC addresses are globally unique. It will only check if the SMAC addresses are unique within the scope of the port on which they reside.

## Acquiring Addresses

Once all requirements are satisfied the wizard will start to acquire addresses from the DHCP server. You can follow the progress in the wizard as shown below.

The **Counters** field at the top show the number of DHCP packet sent and received. The grid below that show a summary of the communication with the DHCP server.

### DHCP Client Wizard

Acquisition Progress

**Status:** Completed

Counters: TX Disc: 3, RX Off: 3, TX Req: 3, RX Ack: 3

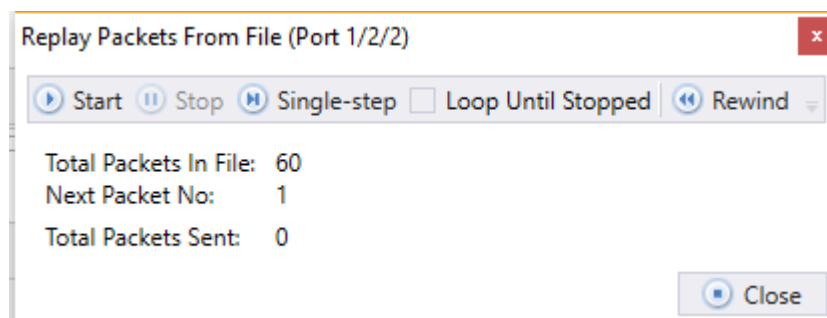

Timestamp	Status
15:44:18.751	Discovering DHCP servers
15:44:20.943	Got address offer 10.0.0.254 for 04:F4:BC:11:49:20 from server
15:44:20.945	Got address offer 10.0.0.249 for 00:01:02:00:00:00 from server
15:44:20.946	Got address offer 10.0.0.251 for 00:01:02:00:00:01 from server
15:44:20.952	Accepting offered IP addresses
15:44:23.303	Got address ACK for 10.0.0.254
15:44:23.306	Got address ACK for 10.0.0.249
15:44:23.307	Got address ACK for 10.0.0.251

Finish

## REPLAY PCAP FILE

The XenaManager-2G is capable of replaying the packets in a PCAP file on a single testport. You access this function through the main **Edit** menu by selecting the **Replay File** menu item when the port you want to use is selected. You will have to reserve the port before the function is available.

When you select the **Replay File** menu item you will be asked to select the PCAP file you want to use. XenaManager-2G supports both traditional PCAP files and the newer [PCAP-NG](#) format. After you have selected the PCAP file then content of the file is imported and a replay control windows will be shown (see screenshot below).

The following commands are available in the control window:

Command	Explanation
Start	Start transmitting packets from the PCAP file as fast as possible. When all packets are sent the replay is automatically stopped (unless the <b>Loop Until Stopped</b> option is selected).
Stop	Stop the packet transmission.
Single-Step	Send the next packet in the packet sequence and stop.
Loop Until Stopped	If selected, the transmission will start over when the end is reached. If not selected the transmission is stopped when the end is reached.
Rewind	Reset the current packet position to the first packet in the sequence.

The following limitations apply to the PCAP Replay function:

Packets will not be re-sent with the original inter-packet timing from the PCAP file. The transmission control is handled by the PC running XenaManager-2G. Packets are sent one at a time and the next packet is not sent until the last packet was successfully transmitted. The transmission timing is thus influenced by both network and Windows OS latency.

The maximum packet size that can be transmitted is 2 Kbyte.

## STREAM WIZARD

This section describes the XenaManager-2G **Stream Wizard** panel.

### Overview

The stream wizard will help you generate a potentially large number of connected streams based on a set of defined stream templates for a given topology.

With the Stream Wizard you can:

- Define persisted port properties so that ports are setup in a predictable way every time you run the wizard.
- Define stream templates to ensure common setup of actual stream instances.
- Define multiple streams per port to allow for different protocol header and rate setup.
- Ensure that source and destination addresses in the protocol headers are set correctly.
- Validate the whole configuration before stream creation.

The Stream Wizard is closely integrated with the **Testbed** concept and will operate on the ports you have included for use in your current testbed. You can thus only have one wizard configuration per testbed.

The Stream Wizard is available in XenaManager-2G version 1.10 and newer.

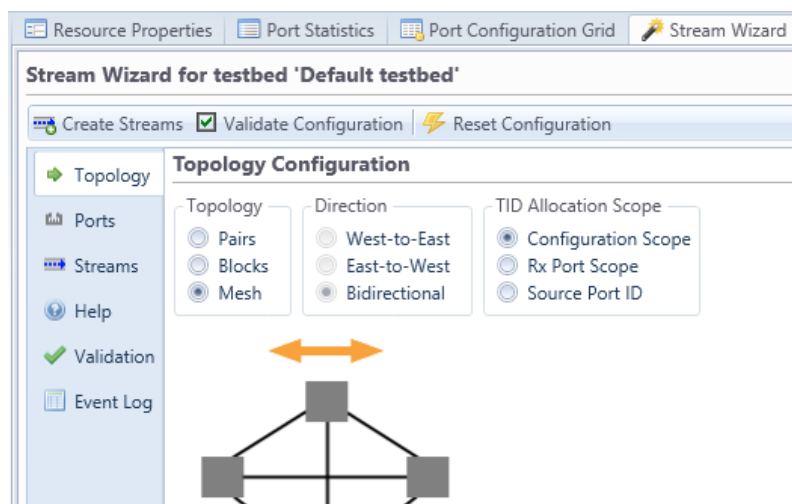

### Getting Started

#### Wizard Panel

The Stream Wizard is controlled through the Stream Wizard panel which is initially located in the lower hidden tab panel as shown below.

When you regularly work with the wizard you may want to “pin” the panel and move it to the main tabbed part of the work area for easier access.

## Step-by-Step Configuration

To define and create a set of streams on your ports please follow these steps:

- Optionally create a new testbed.
- Include a set of ports in the testbed. You don't have to reserve the ports as this is handled by the wizard.
- Set the desired topology in the wizard **Topology** panel.
- Set the value for the desired port properties in the wizard **Ports** panel.
- Specify the number of desired streams per port in the wizard **Streams** panel.
- Also set the value for the desired stream properties.
- Once you are ready you can press the **Create Streams** button to generate the streams.
- You can repeat this cycle as many times as you want if you need to change parts of the wizard configuration.

## Detailed Information

### Toolbar Buttons

The top wizard toolbar contains the following buttons:

**Create Streams:** Pressing this button will make the wizard create the streams defined by the configuration. Before creating the streams the wizard will validate if the configuration is valid. If this check fails the stream creation will be aborted

**Validate Configuration:** Pressing this button will just execute the configuration validation step described above. You can use this to quickly check your configuration while building it.

**Reset Configuration:** Pressing this button will reset the wizard configuration to the default value.

### Topology Settings

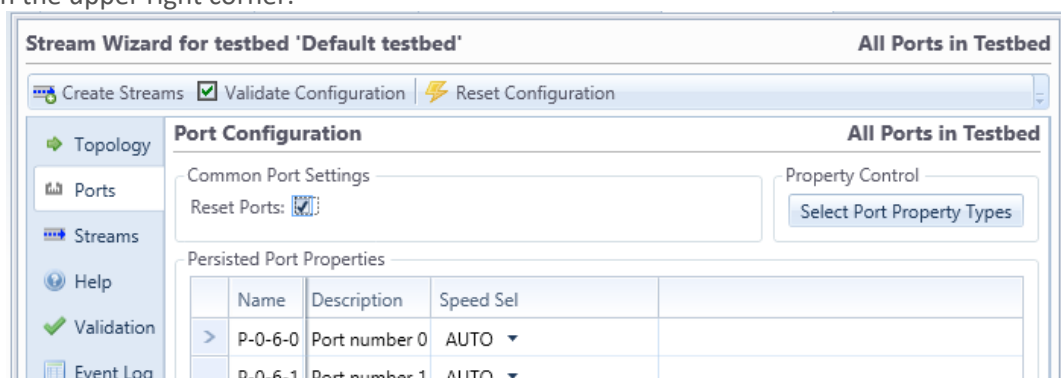

The wizard will generate and pair streams according to the selected **port topology**. The following topology choices are available:

Pairs Topology:	Each port is paired together with another port. These two ports only communicate with each other. There must thus be an even number of ports in your testbed.
Blocks	Each port is placed in either the <i>West</i> or the <i>East</i>

Topology:	group. Each port in one group communicates with all ports in the other group but not with any port in its own group.
Mesh Topology:	Each port communicate with all other ports.

## Port Configuration

The port configuration is handled by the **Ports** sub-tab in the main Stream Wizard panel. It is possible to define a set of properties that will be applied to the ports in your testbed. The default configuration will show a few properties as shown in the image below. But you can choose which properties to apply to your ports by pressing the **Select Port Property Types** button located in the upper right corner.

Any port property that is not specifically set in your wizard configuration will be set to the default value of the port (or left at the current value if you have chosen not to reset the ports).

The **Reset Ports** checkbox will control whether the ports are reset to their default state before applying the specified properties. It is normally recommended to enable this option as it ensures that the resulting configuration is reproducible every time you run the wizard. But you may have special reasons for not wanting to reset the ports, such as wanting to retain a specific custom setup.

## Stream Template Configuration

The stream template configuration is handled by the **Streams** sub-tab in the main Stream Wizard panel. You can define a number of **stream templates** for the configuration using the **Per-Port Stream Count** selector.

Each stream template will be used to create a single stream on each source port for each of that port's peer ports. So if you have 3 ports in your testbed and you specify a Mesh topology each port will have two peer ports. If you define for instance 3 stream templates then each port will end up containing a total of 6 streams where the first 3 streams goes to the first peer port and the other 3 streams goes to the other peer port.

For each stream template it is possible to define a set of stream properties that will be applied to the actual streams in your testbed. You can choose which properties to include by pressing the **Select Stream Property Types** button located in the upper right corner. The type of the selected properties are common for all stream templates but the value for each property can be different for each template.

Any stream property that is not specifically set in your wizard configuration will be set to the default value of the stream.

The **Remove Existing Streams** checkbox will control whether the existing streams are removed before creating the new streams. It is normally recommended to enable this option as it ensures that the resulting configuration is reproducible every time you run the wizard. Note that if you have selected the **Reset Ports** option in the **Ports** sub-panel then all existing streams will be removed regardless of the value of the **Remove Existing Streams** option.

The Stream Wizard will automatically ensure that the Source and Destination MAC and IP fields in the Ethernet and (optional) IP headers will match the port pairing. If the **Resolve Gateway MAC** option is selected then the Stream Wizard will try to resolve the MAC address of any defined gateway addresses and use this address as the DMAC address instead.

## Validation Errors Panel

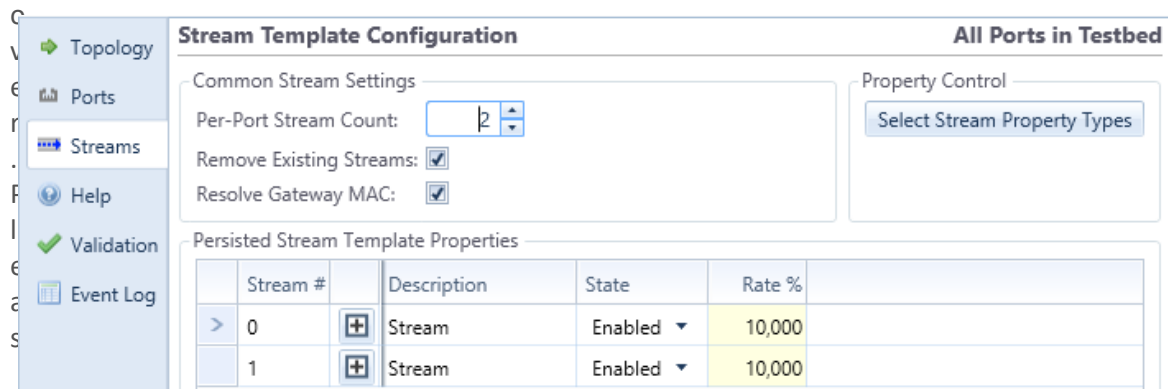

If the configuration validation will reveal any errors in the configuration you can view the detailed list in the **Validation** sub-panel. Each error is shown on a different line. Each line shows both a description of the error, together with the resource type and identifier that caused the error.

## Wizard Execution Event Log

The **Event Log** shows a log of all actions performed by the wizard when creating the streams. This will also show any errors optionally encountered by the wizard when creating the streams.

## Persistence

The stream wizard configuration will automatically be saved as part of the current testbed configuration. You can thus adjust the wizard configuration and re-generate your streams over and

Stream #	Description	State	Rate %
0	Stream	Enabled	10,000
1	Stream	Enabled	10,000

e note that if you make manual changes to the actual port and/or stream configuration after the wizard has created the initial configuration then these changes **will not be retained** in the wizard configuration!

## STREAM SCHEDULER

This section describes the **Stream Scheduler** panel which can be used to build a series of actions based on existing streams in the current testbed.

The Stream Scheduler function is available in XenaManager-2G **version 1.33** and newer.

### Overview

The Stream Scheduler works closely together with the currently selected testbed and works exclusively with the streams defined on the used ports.

### Schedules

Each testbed can contain several schedules. A schedule is simply a collection of operations that will be executed sequentially (although with some looping support as described below).

### Operations

As stated above a *schedule* is basically a collection of *operations* that will affect the traffic generation. The following operations are supported:

Operation Name	Target Type	Explanation
Set Parameter Value	Port or stream	Set the value of a supported stream or port parameter, such as a stream rate.
Wait Period	None	Pause the scheduling for a specified number of seconds, typically to let the traffic run for a specified period of time.
Start Traffic	Port	Start the traffic on selected port(s).
Stop Traffic	Port	Stop the traffic on selected port(s).
Clear Statistics	Port	Clear all statistics counters on all ports used in the current testbed.
Loop Block	None	Enable specifying a block of operations that can be repeated for a specified number of times.
Enable Stream	Stream	Enable selected stream(s).
Disable Stream	Stream	Disable selected stream(s).
Suspend Stream	Stream	Suspend the selected stream(s).
Custom Port Command	Port	Send a custom command to the port(s) selected as targets for the command. This command can be any port-level script command. See <a href="#">this link for details</a> .
Custom Stream Command	Stream	Send a custom command to the stream(s) selected as targets for the command. This command can be any stream-level script command. See <a href="#">this link for details</a> .

**Note on custom commands:** The scheduler will perform a certain level of consistency checking on the normal commands but it will not be able to perform any consistency check on any custom commands.

### Targets

Some operations can be performed on selected *targets*, which are either streams or ports. These operations can either apply to all valid targets or you can select exactly which targets you want the operation to operate on.

Valid targets are ports included in the current testbed or streams defined on those ports.

Certain operations, such as the *Wait Period* operation, are not associated with any specific targets as they apply to the schedule as a whole.

## Common Scenarios

This section explains how to perform common schedule operations.

### Creating a Simple Schedule

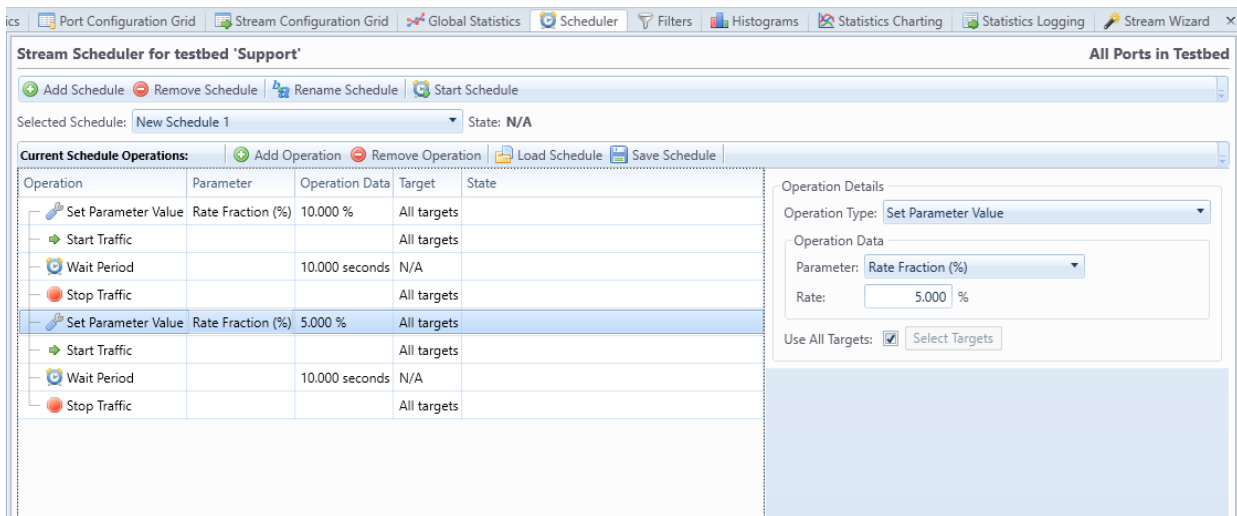

First you should setup a simple configuration consisting of two ports, each with a single stream paired to each other (you can use the **Stream Wizard** for this). Then you can perform the following actions in order to define a simple schedule for your streams:

1. Bring up the **Scheduler** panel by selecting it in the lower panel strip. Push the little “paper-pin” in the upper right corner to prevent it from auto-hiding.
2. Add a new schedule by clicking the **Add Schedule** in the upper panel toolbar.
3. Click the **Add Operation** button in the schedule operations toolbar and select the **Clear Statistics** operation in the list.
4. Also add the following operations in the specified order:
  - Set Parameter Value
  - Start Traffic
  - Wait Period
  - Stop Traffic
5. You should just use the default value for each operation for now.
6. Press the **Start Schedule** button in the upper panel toolbar. The schedule will now perform the specified operations and stop after that.

### Changing the Packet Rate

This section explains how to change the packet rate of the streams after a while. Your streams will start with a 10% rate but after 10 seconds their rate will drop to 5%. The section will extend the schedule defined in the last section.

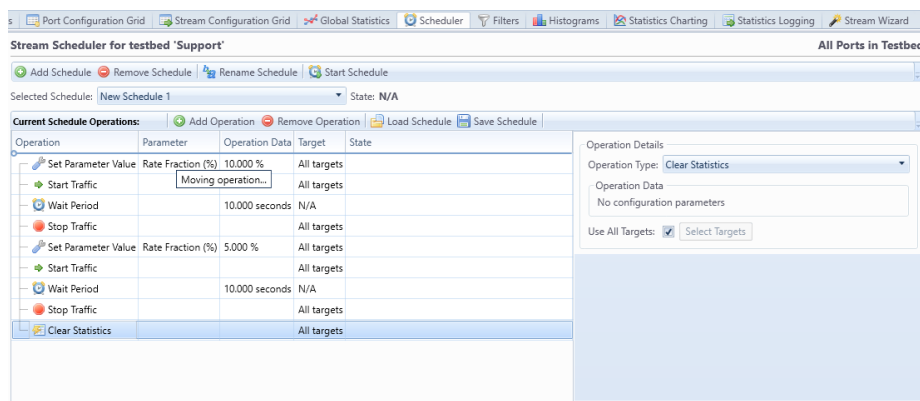

Perform the following actions:

1. Select the last “Stop Traffic” operation and insert these additional operations after it:
  - Set Parameter Value
  - Start Traffic
  - Wait Period
  - Stop Traffic
2. We need to stop the traffic while changing the rate value as the Xena tester does not support rate changes while the traffic is running.
3. Select the second “Set Parameter Value” operation and change the **Rate** value to e.g. 5% as shown in the image to the right.
4. Press the **Start Schedule** button in the upper panel toolbar. The schedule will now again perform the specified operations and stop after that. If you want to follow the progress of the rate you can use the **Statistics Charting** panel for that.

## Changing the Operations Order

This section explains how you can insert a new operation and move it to the desired location. Perform the following actions:

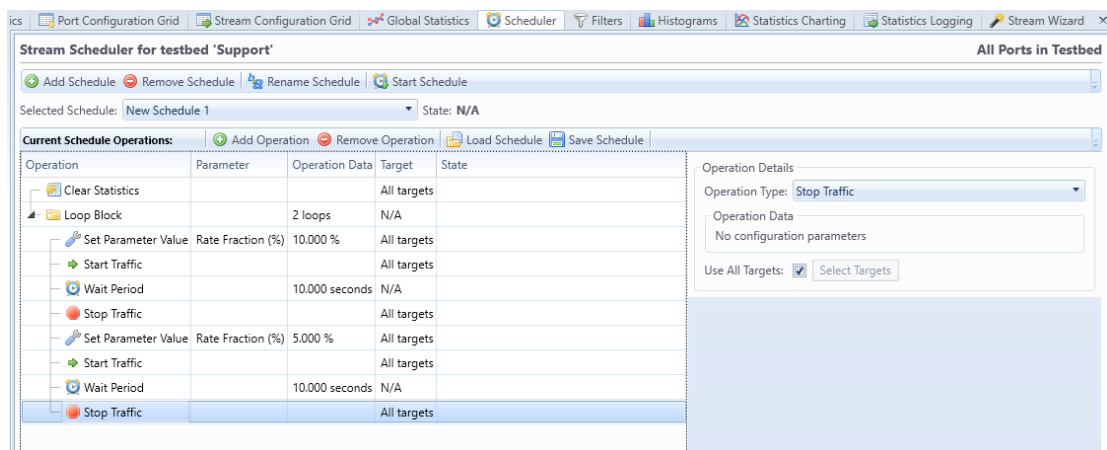

1. Add a single **Clear Statistics** operation to the end of the list.
2. Drag the new operation to the top of the list until you see a guideline on top of the upper-most operation (see screenshot).
3. Drop the operation at the new location.
4. Now all statistics counters will be cleared before traffic is started for the first time.

## Adding a Loop Section

It is possible to repeat a group of operations for a specified number of times by adding a **Loop Block** operation. This operation can contain a number of other operations which will be executed sequentially the specified number of times.

Perform the following actions to add a loop block with a repeat count of 2 and to move most of your existing operations into it:

1. Add a **Loop Block** operation to the end of the list.
2. Using the mouse drag and move the loop operation just below the top-most clear operation.
3. Drag the operation just below the loop block on top of the loop block so that it is shown indented compared to the loop operation.
4. Drag each of the other operations to the bottom of the previous operation as shown in the screenshot until they are all indented under the loop block.
5. Start the schedule and observe that all the operations in the loop block are executed twice.

Loop blocks can be nested so that one loop block can contain another loop block.

## STATISTICS LOGGING

### Overview

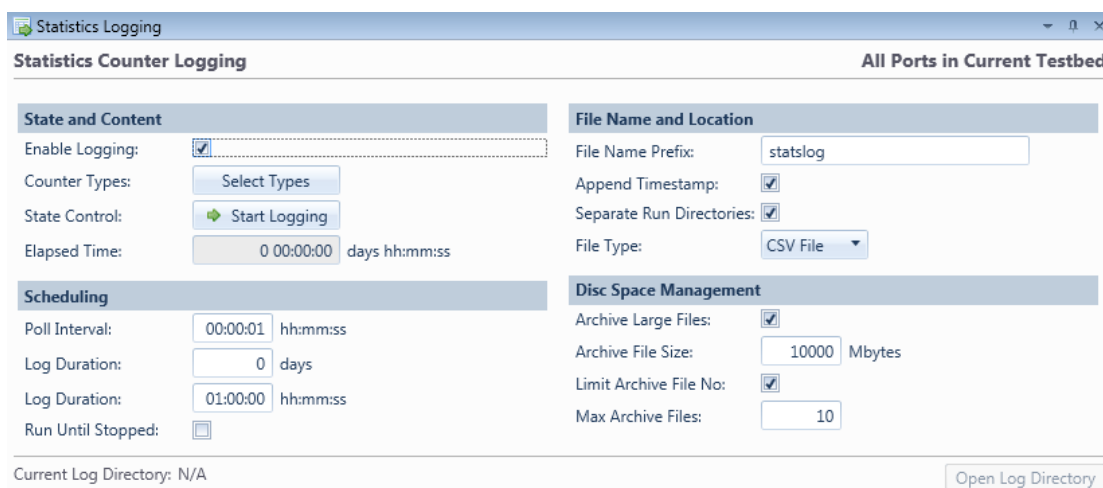

The **Statistics Logging** function allows you to periodically poll statistics counters for all ports in a testbed and log those counters to a CSV or XML file. This feature is intended to replace the **equivalent feature in the XenalIntegrator**.

### Port Scope

The logging function works on all ports in a given testbed. You can enable logging on multiple testbeds at the same time.

### Configuration Panel

This function is handled by the **Statistics Logging** panel. This panel is by default shown in the bottom part as one of the “auto-hide” panels. The panel is shown in the image below.

### Logging Configuration

The **Statistics Logging** panel provides the following configuration options:

Option	Explanation
<i>State and Content</i>	
Enable Logging:	Selects whether this statistics logging definition is enabled or not.
Counter Types:	Pressing this button will enable you to select which counters to include in the log. See below for a detailed description of the available counter types.
State Control:	This button will either start or stop a logging session.
Elapsed Time:	Shows the elapsed time for an active logging session.
<i>Scheduling</i>	
Poll Interval:	Specifies the interval between polls. The default value is 1 second. The minimum value is 1 second.
Log Duration:	Specifies the total desired duration of a collection period. You can specify this duration as a number of days + a hour::minute::second option. The total duration could thus for instance be 2 days, 4 hours and 30 minutes.

	This option is only valid if the <b>Run Until Stopped</b> option is not selected.
Run Until Stopped:	If this option is selected the collection will run until it is manually stopped.
<i>File Name and Location</i>	
File Name Prefix:	This string will be used as the prefix for the logging filenames.
Append Timestamp:	If selected a timestamp on the form "YYYYMMDD_HHMMSS" will be appended to the filename.
Separate Run Directories:	<p>All logfiles will be located under the &lt;ProgramData&gt;XenaXenaIntegratorPortLog directory. If this option is selected the logfiles for different logging runs will be placed in separate subdirectories under this master directory. The subdirectory name will be a timestamp on the form "YYYYMMDD_HHMMSS".</p> <p>If the option is not selected all logging files will be placed directly in the PortLog directory described above.</p>
File Type:	This determines the format of the logfile. You can select between CSV (Comma Separated Value) or XML format.
<i>Disk Space Management</i>	
Archive Large Files:	<p>Selecting this option will make the logging function save the current logfile to an archive file and start a new logfile when the logfile reaches a certain size.</p> <p>The archive files will be named &lt;prefix&gt;.&lt;archive no&gt;.&lt;extension&gt;. The archive numbering will be sequential so that the file with the highest number is the most recent archive file. The currently active logfile will still be called &lt;prefix&gt;.&lt;extension&gt;.</p>
Archive File Size:	The file size where archiving should take place.
Limit Archive File No:	If this option is selected the application will limit the number of archive files for a single logging run. This can be used for long-running logging tasks to prevent the harddisk from filling up.
Max. Archive Files:	The maximum number of archive files to keep. This option is only valid if the <b>Limit Archive File No</b> option is selected.

## L2 Counter Types

The following counter types are available:

L2 Counter Type	Explanation
TxBps	Transmit rate (bit/sec)
TxFps	Transmit rate (frames/sec)
TxBytes	Transmitted bytes
TxFrames	Transmitted frames
RxBps	Receive rate (bit/sec)
RxFps	Receive rate (frames/sec)
RxBytes	Received bytes
RxFrames	Received frames
RxSeqErr	Number of lost frames due to non-incrementing-sequence-number errors.
RxMisErr	Number of received swapped-sequence-number disorder errors.
RxPldErr	Number of received packets with non-incrementing payload content.

LatencyCurr	The average latency for the last second in microseconds. Only available in newer Xena chassis firmware versions.
LatencyAvg	The average latency for the whole time period in milliseconds.
LatencyMin	The minimum latency for the whole time period in milliseconds.
LatencyMax	The maximum latency for the whole time period in milliseconds.
JitterCurr	The average jitter for the last second in milliseconds. Only available in newer Xena chassis firmware versions.
JitterAvg	The average jitter for the whole time period in milliseconds.
JitterMin	The minimum jitter for the whole time period in milliseconds.
JitterMax	The maximum jitter for the whole time period in milliseconds.

## Importing Legacy XenaIntegrator Configurations

It is possible to import a legacy XenaIntegrator **Port Logging Definition** as a new XenaManager-2G testbed. Since the XenaIntegrator Port Logging Definition contains a definition of the ports which will provide the logging counters the import process will automatically perform the following steps:

- Check if the Xena chassis defined in the legacy configuration are already defined in the XenaManager-2G configuration. If not, the necessary chassis definition will be created.
- Create a new testbed with the name "Testbed XI: <definition label>" where <definition label> is the name originally used for the Port Logging Definition in XenaIntegrator.
- Add the defined logging ports to the new testbed.
- Migrate the other logging configuration to the new testbed.

To import a legacy XenaIntegrator Port Logging Definition simply click the **Import XI LogCfg** button in the **Operations** menu and select the XenaIntegrator configuration file you want to import.

## Controlling Logging State

### Starting and Stopping Logging

As stated above the **State Control** button allows you to start or stop the logging process. While the logging is in progress it will not be possible to change any configuration parameters.

### Monitoring Progress

While the logging is in progress the **Elapsed Time** counter will increment showing the total duration of the logging process.

The **Current Log Directory** field will show the full path to the current logging directory. Clicking the **Open Log Directory** button will launch a Windows Explorer in this directory.

## Output Formats

### CSV File Format

The CSV file will contain a number of lines. Each line will represent all enabled logging data for one port for a single poll. A line will have the following format:

<Timestamp>, <Port ID>, { <CounterValue>, }\*

Field	Explanation
Timestamp	The data and time for the logged data line on the form "YYYYMMDD-HHMMSS".
Port ID	The port identification on the form "P-<chassis>-<module>-<port>",
CounterValue	The counter value. All values are expressed as a decimal number.

The file will also contain a header row describing the selected counter types.

### XML File Format

The XML file format will be similar to the following example:

```
<?xml version="1.0" encoding="utf-8"?>
<!--XenaIntegrator Statistics Counters-->
<PollSamples>
  <SelectedCounterTypes
Values="TxBps,TxFps,TxBytes,TxFrames,RxBps,RxFps,RxBytes,RxFrames"
/>
  <Element Timestamp="20130331-174155" Type="Notification"
Text="Log initialized" />
  <Element Timestamp="20130331-174156" Type="Sample" Port="P-0-10-
2" Values="0,0,0,0,0,0,2.91E+06,4.3E+04" />
  <Element Timestamp="20130331-174156" Type="Sample" Port="P-0-10-
3" Values="0,0,0,0,0,0,1.51E+05,581" />

  <etc>

</PollSamples>
```

All data is kept under a root tag called **<PollSamples>**.

The first node is called **<SelectedCounterTypes>**. The “Value” attribute describes the selected counter types in comma-separated format.

Each poll sample is represented using the **<Element>** node tag and has the “Type” attribute set to “Sample”. The “Values”

attribute contains the sample values in the same order as is given by the **<SelectedCounterTypes>** tag.

**<Element>** nodes with Type = “Notification” represents notification messages.

## STATISTICS CHARTING

This section describes the **Statistics Charting** panel which can be used to view a real-time chart of various statistics counter values from selected streams.

The section describes the new version of the charting panel introduced in XenaManager-2G version 1.43. The original simpler charting panel is no longer supported.

### Overview

#### Charted Parameters

The charting panel allow you to view realtime charts of a number of monitored parameters. You can define multiple charts within the chart panel which can each display separate parameters. Each panel can optionally display two different parameters where each parameter then is associated with its own Y-axis (left or right).

#### Selecting Data Sources

The charting panel will always be associated with the ports and streams in the current testbed. It is possible to select exactly which streams are used by each individual panel.

#### Counter Types

It is possible to chart all the counter types available in the statistics panels.

#### Port Polling Aspects

When charting receive-side counters it is important to ensure that the port(s) you expect the packets to arrive on are polled for counters.

To decrease the performance impact of too much polling the XenaManager-2G will by default only poll ports that are visible in a panel that requires the polled information. This primary includes the various statistics panels. So if you are currently not viewing e.g. the statistics panel for a given port the port may not be polled.

When you add a stream to the charting function the XenaManager-2G knows which port this stream is defined on and will ensure that any such port is polled. This ensures that any transmit-side counters will always be polled. But the XenaManager-2G cannot know which port(s) the packets sent by the streams actually arrive on. You need to help the XenaManager-2G by either ensuring that you are viewing the statistics panel for the receiving port or by enabling the the **Poll Always** property in the **Port Receive Statistics** toolbar in the **Port Statistics** panel.

### Charting Details

This section explains how to configure and use the charting function.

## Chart Control

### Add and Remove Charts

You can add any number of charts to the chart panel. The defined charts will be stacked vertically on top of each other.

To add a new chart simply click the **Add Chart** button in the top toolbar. You can now select the parameter type which you want to be charted from a dialog.

To remove a chart simply click the **Remove Chart** button in the chart toolbar. If you want to remove all charts you can also click the **Remove All Charts** button in the top toolbar.

### Start and Pause Charting

When you have added the chart(s) you want to use you need to start the charting function by clicking the **Start Charting** button in the toolbar. To pause the charting function you can click the **Pause Charting** button. You can re-start the chart by clicking the **Start Charting** button again.

The data will continue to be collected in the background so the chart will be fully updated with the collected data once you resume charting.

### Add a Second Parameter

When you add a chart the selected chart parameter will by default be associated with the left Y-axis. It is possible to add a second parameter to a chart by clicking the "Add 2nd" button in the chart toolbar. The second parameter will be associated with the right Y-axis.

### Selecting Stream Sources

By default all streams in your current testbed will be part of the charts. The streams are shown in the legend below each chart.

You can select which streams are part of a chart by checking or unchecking the checkbox in front of each stream in the legend. You can also control the state for all streams by using the **Select All** and **Deselect All** buttons in the panel toolbar.

### Visual Aspects

#### Controlling Chart Size and Visibility

The size of each chart can be controlled by holding and dragging the dotted handle at the bottom of each sub-chart. It is also possible to control the visibility of a chart completely by clicking the little “plus/minus” icon in the right side of the chart header.

#### Chart Sample Span

The number of samples in the chart is determined by the **Max Samples** property in the panel toolbar. Once the total number of samples in the chart has reached this number older samples will be dropped from the chart when new samples are added.

#### Controlling Tooltip

By default a rather large tooltip with information about the plot points under the mouse will be shown when you hover the mouse over the chart. You can disable this function in the panel toolbar.

#### Zoom and Pan

You can use the chart scrollbars to zoom and pan the results [as described on this page](#).

#### Taking Snapshots

You can grab a snapshot of the charts by using one of the **Snapshot** buttons. This action will generate an image and copy that to the Windows clipboard. You can then paste it into your favourite reporting tool, such as Word or Excel.
